Hello

I would like to invite all Radio Amateurs in the world with web pages

to add their web site to the Amateur Radio World Ring
http://www.g6dpp.com/worldring/world_ring.html

The Amateur Radio World Ring Linking Radio Hams sites from all over the world.

73's
David G6DPP
Ringmaster Amateur Radio World Ring

Right. There have even been examples of porn site advertisements getting
into worldwide packet BBS bulletins which were actually digested forms of
Internet mailing lists (about amateur radio topics).

Hello to all.
I would like to do a link between 2 PCs that are about 10 km apart. Wiring is out of question (to expensive). Now they are connect by a dialup connection (it only needs about 1h every day and the call is local). The connection doesn't need a lot of bandwith, but 9600bps is the minimum. A 50kbps would be great. I was thinking in something like a radio modem, preferably all in one box, no radio to buy apart. I had seen references to part 15 devices, what are those things (to someone that is in Portugal, that doesn't tell a lot), are the same thing that IEEE 802.11? And are capable of going all the 10 km (with some hills between).
References to hardware manufacturers would be nice, schemes of how to do would be great. The software of the terminals can be linux, dos or windows. TCP/IP is a must.
To say that the connection is only suitable if it's in the US$100-150 cost by point of the network (or the phone connections are still the best way to do it).
I seen that sometimes the answers in this ng became someting like flame wars, but remember that if you say RTFM, a location of the FM is a must.
(BTW, is there a faq for the ng? the one I found was dated 22 Oct 93)
thanks
Luciano Almeida

PS. If you are seeing this message twice is because I posted twice. I couldn't see it outside my news server

The reason for the flame wars is that this newsgroup is about
amateur radio computer networking - not cheap substitutes for
leased lines or other facilities that cost money.

For your information, a Part 15 device is a low-powered radio
device that is not subject to licensing. Each country has
a similar description.

Part 15 radios still wouldn't do what you need to do.

Hi Boss,
    I have received a while back a copy of the article. (It was in QST back
about 1990/91). I just need to find it. I don't remember if I saved it on my
Website, but will check. IF I did, I will Post the URL for it....

While an admirable project, the EPIRB, a marine distress locator is already
in widespread use. Dependent on the model, it uses GPS positioning or just
satellite calculations.

One thing that might help get funding:
    Design a Military or Government use as the 'main' reason for this
device/product
and then add a civilian 'ham' version of it. Backers will jump on the
Military Sales
potential bandwagon much faster than the mysterious (Unknown) Ham Radio
Market.
- Just a thought from a company that did JUST that for 10 years, before
selling the company for PROFIT. (We designed Aircraft simulator components
that also double with the right software as 'satellite antenna positioner'
controllers. Company name was ThrustMaster.

I am trying to follow the directions for installing Precision Mapping on WinAPRS.

The first step says to unzip PMAP_OCX.zip. I cannot locate this file in the winaprs directory or on the PM CD.

Where do you get this file?

Thanks

Xastir has soundcard support. You can get the latest version at:

http://home.earthlink.net/~fgiannan/xastir/

...But that is NOT advised in my area (Los Angeles), and I believe that in parts of Ohio, such numbers are also assigned.....

The Los Angeles area does have coordinated IP addresses with the third octet being greater than 64 in value. Such was done before Brian changed the rules.

Yes, you're wrong. Why wouldn't it work? How would it even
know what the hardware interface was, since AX.25 and the
drivers that go with it are a fully-integrated part of Linux?
It sometimes sounds like people don't really understand how
real operating systems do this stuff...

I had a look at the source for xastir, and all it does is open
an AX.25 socket and use it. Which is exactly what it should
do. It has some sound alert facilities that will fight with
the sound card modem code, but that's another matter.

> I any case how is Soundcard Packet in Linux?

Written by the same folks who did FlexNet with sound cards.
Same algorithms, same hardware.

At 9600, you would like 80 ms. or better. The little TEKK rigs can
do 50 ms. I find that many synthesized radios can actually manage
100-120 ms. without problem (e.g. tm-421).

Using a soundcard also isn't going to make you happier... you need audio coverage down to a few Hz or preferably to DC. Soundcards are designed for audio and smallish speakers. You may be able to increase the values of coupling capacitors, but with some bad luck there is filtering that you cannot work around.

I have once converted a commercial FM transceiver that had really true FM in that a small variable DC voltage on the line input would actually sweep the output frequency over a few KHz range. True DC coupling of the modulation. I was also able to replace a series capacitor in the RUH modem with a wire bridge, and have never seen such a nice eye pattern on the scope. It looked just the same as a local loopback, no "jittering" and all lines going through a very small crossing area.

Hold on there bobalouie. I'm hope Linux overtakes. I'm glad to hear it
works AND someone is actually doing it. The thing is, I have Flex
working in DOS/WIN but can't find a APRS program fer it. What better

than to hear someone actually using it. The combo I am asking about is
Linux AND Soundcard AND APRS. If we can an easy to use home install
with Linux, it will fly. I like is robustness yet it needs to work for
mom too. :)

That's cool.

I guess what I'm asking for are the adantages of running soundcard/APRS
and such on Linux compared to Windose.

Crystal-controlled rigs tend to be faster than PLL synthesized in general, but even crystal-controlled transmitters run into T/R and R/T turn-around time limitations in the audio chain. Just because the radio is spewing RF doesn't mean it can actually modulate it properly, and sometimes the radio will be deaf long after it stops transmitting.

I found the UHF Motorola Flexar/Maxar series work well at 70mS with no modification.

I don't think Brian handles anything now eh?

The object is to link radios. If you're never going to hook it to

the Internet (Chuckles says this is Bad! ...bad, bad...) then who
really gives a squat eh?

I think your BBS club is a proponent of non-wireline, so WTFO eh?
Pick a number, get all your club members to use it, "be happy..." eh?

amprhosts is for Internet routing. If you are against that, then what's
wrong with using 10, 192.168, 45, or even 24 eh?

Are you saying it is alright to hook Ham radio up to the Internet eh?

The modified trx I described in the other message (AEG Telecar TE) is
routinely operated at 30ms. Just to give the average receiving station
a bit more to work with. I tested it and it worked fine at 10ms Txdelay.

The TEKK should be capable of the same.

This can be the case when it does not use Kernel AX.25 but talks to a TNC
connected to a COM (tty) port.  Some programs do that.
You can circumvent that when you have a suitable emulator for the TNC type
they expect, and interface that via a pty.

The situations are completely different. Since DOS/Windows has no native AX.25 support, there is no standard, and every software package must do it more-or-less monolithically, from scratch.

The FlexNet API is published, so you could write your own FlexNet APRS program if you wanted to. This would be one way of getting the application you want. Building on the FlexNet drivers, it would be oblivious to the underlying network interface. Just as all FlexNet apps are.

You get this for free under Linux. The question is not "APRS + soundcard + Linux", but "APRS + Linux", because the network is already there, the interface to the outside world is in place, provided by the OS, and applications simply use it. The interface is well known - BSD sockets, with AF_AX25 as an available address family.

Applications don't know whether they're talking to a

KISS TNC or a sound card or an SCC card or a Baycom
modem, and they don't care. It just works.

Clarification perhaps?

"can do" means "I have links using TEKK radios
running with txd of 50 ms."

"can actually manage" means "I have one link using said radio
running at said txd".

> Crystal-controlled rigs tend to be faster than PLL synthesized in general,

Very true. The Kantronics D4-10s can run a bit faster. With very good
paths we have been able to go as low as 40 or sometimes 30 ms. at
9600 baud. Have not had good luck at 19200 though, even with very
good paths.

> I found the UHF Motorola Flexar/Maxar series work well at 70mS with no

They hold up better than the TEKKs at remote sites ... and have less
intermod problems ...

I am having trouble with getting WINAPRS to work Precision Mapping. The maps improve from the distribution version, meaning they are in color and zoomed out I see the major highways, but zooming in just makes the highways dissapear. The route markers stay.

Anyone else having or had this problem?

/Len

It also serves the unique addressing of amateur radio stations, and division into subnets. When you want to route along some nodes in the amateur network (when available locally), you will probably need a 44 address, as all the routes in the routing tables are geared towards the subnets on that network.
(i.e. in most nodes there will be no route for net 10 or it will point to a default interface)

This was one of the first batch. I built it with great care, and installed a 10-turn POT and did the suggested mods, and tuned it to "prefection" with an 0-scope. Excellent QRP rig, worth its weight in gold. Unfortunately, I just don't have the time for radio these days, and I need to pass this baby on to someone who can enjoy it and get some use out of it.
I am asking the same price I paid for it, because it's worth it, and it's in good shape. PRICE: $120.00 + $5.00 priority mail shipping.

Email me if interested. Prepayment with M.O. or check preferred.

The objective is to build ham radio network.
Ham radio uses net 44. Perhaps you forgot that in your confusion
between your radios and your telephone.

> I think your BBS club is a proponent of non-wireline, so WTFO eh?
> Pick a number, get all your club members to use it, "be happy..." eh?

What BBS club?

Yes, I suppose you could write such a program if you really
wanted to make life difficult for yourself. Do you have an
example of such a program?

Difficult? Not at all.   I've an X11 program (that I grew bored
with so never finished) that implements AX.25 in userland and uses
a TNC in KISS mode to get the bits in and out to the box. Why?
Because the world isn't Linux and my *BSD boxen don't have kernel
mode AX.25.   APRS was the second thing I implemented (receive only)
as there are no states to worry about.   The first thing was the
equivalent of an AX.25 packet analyzer.

Someday I may finish it. But if I do I'll use soundcard DSP instead
of a TNC as that way I'll be able to add psk31, too.

You are correct, sir.

> Are you saying it is alright to hook Ham radio up to the Internet eh?

Even then - there things like proxies, which allow you to use just one address. Poor DSL/Cable Modem guys - having to provide gateways to Radio Networks.

This isn't a bad suggestion, actually. Pick some network 10
addresses, set up your network, get it going (non-trivial!)
and then migrate to "proper" network 44 addresses when you
get them.

Lots of private networks use network 10.

Since this thread is about APRS under Linux, I wasn't worrying
about other OSs. In this thread the world *is* Linux, and any
Linux network program that didn't use kernel mode AX.25 would
have to have an awfully good reason not to.

I'm still waiting for an example...

The usual tcp/ip bigot's idea: if your hosts are not directly on
the internet, then they are not part of net 44. Total nonesense.

> This isn't a bad suggestion, actually. Pick some network 10
> addresses, set up your network, get it going (non-trivial!)

How do you do this migration if you cannot get a response from
the appropriate address coordinator? It is a totally useless suggestion.

You might better use an address in the appropriate subnet of net 44,
then you will be able to communicate with other hams running tcp/ip.
Perhaps they will be able to tell you what to do about that address
coordinator who is not doing his job.

> Lots of private networks use network 10.

The discussion was not about private networks, but about the
ham radio tcp/ip network aka net 44. Lot's of private networks
also use subnet 192.168. Has nothing to do with anything.

Most Windows programs are like that. I use this method to run UIview in a
Windows95 VM under VMware.

It isn't really difficult.

It wasn't mean't to be a political or religious suggestion, or even one to encite self-oscillation in a BBS club. It was only mean't to be a suggestion, that if you want to set up a radio IP network, and your coordinator is dead, missing, or can't be bothered, that you might pick some other number, and develop your interest.

> How do you do this migration if you cannot get a response from the appropriate address coordinator? It is a totally useless suggestion.

You are not going to find the address coordinator via your IP radio station. You don't have an IP station until you find the coordinator. Meanwhile, rather than wringing your hands on what to do, the most obvious thing to do (after a lengthy missing-persons report on the coordinator) is to just have fun.

> > Lots of private networks use network 10.

I don't want to relive ancient history, but go back to the day that the class A resource was given, and ask yourself if your not being just a little bit stupid in continuing to use it. A lot has occurred in IP networking since those long days ago.

This would make it very hard to connect your new host into the
existing tcp/ip network. What is the reason to *not* use an address
in the local subnet?

> > How do you do this migration if you cannot get a response from
> > the appropriate address coordinator? It is a totally useless suggestion.

The point, Steve, is a simple one. For some subnets, there is not
a coordinator. If nobody tells Brian about this, there never will be
a coordinator for that subnet. So you might as well go directly to

Brian and get things fixed.

> You are not going to find the address coordinator via your IP radio station.

That's for sure! The coordinators for my local subnet has not been on ham radio digital modes for at least 11 years, if ever. The coordinator for one of the adjacent subnets went off air 7 ot 8 years ago. He is a bit hard to reach since his phone is unlisted. You have to write him a letter, and he might answer it ... or might not. Some folks that should be in that subnet have given up and gotten addresses in an adjacent subnet instead.

> You don't have an IP station until you find the coordinator.

Huh?

> Meanwhile, rather than wringing your hands on what to do, the most obvious thing to do (after a lengthy missing-persons report on the coordinator) is to just have fun.

To whom would you send that missing persons report?
Let me guess: to Brian, as I sugested in my response that caused all the flames. Duh ...

> > > Lots of private networks use network 10.
> >
> > The discussion was not about private networks, but about the ham radio tcp/ip network aka net 44. Lot's of private networks also use subnet 192.168. Has nothing to do with anything.
>
> I don't want to relive ancient history, but go back to the day that the class A resource was given, and ask yourself if your not being just a little bit stupid in continuing to use it. A lot has occurred in IP networking since those long days ago.

Exactly the point. Someone would be stupid to use anything other than a net 44 address over ham radio. Nobody could talk to them.

A related issue is the state of the assignments. There are assignments to folks who have died, have moved into different subnets, have changed callsigns, etc. There appears to be no mechanism to keep the assignements anywhere near close to reality.

Yet another issue is how to percolate radio network routings into the internet. There does not seem to be any move toward a solution of this "interesting" problem.

Example: you cannot ping i386.w0rli.ampr.org from anywhere on the internet, even though there are (at least) three different ways to reach that (radio only) host from the internet over ham radio network links. The tcp/ip community has simply not found any way to solve this particular problem.

These are things that need to be fixed, to make tcp/ip a more viable option for ham radio.

Only because you are "out to lunch", and can't see the future. Of course there are "moves" going on. Most of these folks are working at places like Motorola and Qualcomm, etc.

> Example: you cannot ping i386.w0rli.ampr.org from anywhere on

Of course they could. The problem is - noboby gives a poop about amateur radio applications, because of attitudes like yours - which stifle the obvious Internet backbone solutions. Commercial Internet-backboned RF networks are the future.

> These are things that need to be fixed, to make tcp/ip a more
> viable option for ham radio.

You got that right. Nobody is going to mess around with ham radio solutions, when they can make millions of dollars doing the same thing with commercial applications.

Of course it is a dull job to be a coordinator. I know it, I am one of
them myself. But with a couple of small scripts it is not that bad...
Just read the person's mail, add a line to the file, and let the script
to the rest.
Still not very rewarding, as you will get all the flak when people want
things that are not foreseen in the subnet assignment plan.
(suggesting them to write a better plan usually quiets them)

What I would find bad is when a person sits on his "coordinatorship" but
is unwilling to perform the task. I don't think that is the case there.
Probably there just isn't anybody who is willing to provide this service
in your area.
When that is a nuisance, just go do it yourself.

Rob

Stop it. The suggestion was, there were no existing IP networks, and
the user wanted to set one up. Otherwise he could have just contacted
the person he heard on the air instead of a worldwide newsgroup.

> The point, Steve, is a simple one. For some subnets, there is not

My only sub-point had to do with what the interested party did
during the time that all this coordination would consume.

> Huh?

Who?

> Duh ...

Really!

> Exactly the point. Someone would be stupid to use anything other
> than a net 44 address over ham radio. Nobody could talk to them.

Your suggestion that using a 44 address is going to solve all problems,
is bogus at best, if there is no current 44 network. You're assuming some
other 44 net will be reached, and the chances are, that it won't be
reached during your lifetime. This may be hard to understand in a city
that has intelligent stop-lights every quarter of a mile, but out on the
prairie, it's another story. You may *never* run into a digital ham group.

> A related issue is the state of the assignments. There are assignments

It used to be, that someone could step up and take charge and edit the ampr list, but hackers put an end to all that. Even still, you could ask for a password and become the editor if not the coordinator.

> Yet another issue is how to percolate radio network routings into
> the internet. There does not seem to be any move toward a
> solution of this "interesting" problem.

Go read all the poop at www.ampr.org as it has a very narrow vision of what net 44 is and will ever be. Pretty dry, and not very interesting. Whoever wrote that HTML doesn't drink beer in a social setting.

> Example: you cannot ping i386.w0rli.ampr.org from anywhere on

Most ham routers don't know what to do with non-44 net addresses and drop them by default (X-1J for example).

> These are things that need to be fixed, to make tcp/ip a more
> viable option for ham radio.

Yes. But not under the current top-level management. You can't fight city hall, and sometimes it's better to find another solution. One that is more dynamic and real-time; and, there are other solutions.

What I am proposing, is the 44 net has outlived its usefulness, and I can think of two ways to do the same thing.

In other words, folks who work for companies that would stand to make a
bundle of cash any time Hams lose spectrum. - Particularly in light of
"wireless Internet".

> > Example: you cannot ping i386.w0rli.ampr.org from anywhere on
> > the internet, even though there are (at least) three different ways

> backboned RF networks are the future.

Actually that is not the future, but the "present" way that many commercial
outfits are doing things. Railroads, for example. - But none of these
commercial outfits is "Ham Radio", and Ham Radio is not a commercial outfit.
What works well for them can be a very efficient way for Hams to shoot
themselves in the foot.

Different objectives require different means of getting there.

When the no-code tech liscense was brought up, we Hams heard a lot about all
the "expertise" we would get from the telecommunications industry... What we
got instead from that industry were a bunch of narrow-minded morons who
can't see past their own noses, and who have no real interest in Amateur
RADIO. - Along with a goodly portion of characterless jerks who repeatedly
try to talk Hams into doing things which will lead directly to loss of

spectrum. I suppose they figure that if they can undermine Ham Radio and claim credit for it, they might get a raise or a promotion.

>

There it is again, the typical LandLine Lid confusion between the motivations of Amateur Radio operators and the motivations of commercial outfits.

If you are not really interested in being a Ham, why not do the decent thing and turn in your license?

I have moved to a new QTH and no longer need my tower. It is a a US Tower 40 foot (MA-40) crank-up. Galvanized steel, in good shape. the tower is down and ready for transport and includes 2 coax standoffs, base and wall mounting bracket.

The tower is located in the Baltimore Area. Please contact me by E-mail if you are interested.

This is going to sound like a troll, but bear with me.

I have not really kept track of Ham Radio for quite a while now. Starting in electronics in the 1970's, I got a lot of exposure to ham, but never got a licence.

Since I lost track of ham, there have been at least two developments that should hit ham radio like a bombshell, namely digital voice compression (mpeg) and also digital video compression (mpeg again).
Voice compression should allow voice traffic to go to very narrow channel modes, with a resulting dramatic increase on the number of people able to get on a given band, plus the greater accuracies and longer range receiption afforded by digital error correction.
Digital video, mpeg-1 style, should change ATV entirely, allowing ATV work in much narrower bandwidth, and much lower frequencies.
Could it even allow DX ATV ? I don't see why mpegs cannot completely replace slow scan.
I know some of this technology is pretty new, but is anyone doing this/ working on this ?

Thanks in advance.

Actually, I was never a no-code Ham, as if that really mattered one way or another. Lots of great no-code Hams out there.

I started off as a 5wpm novice, and by the time I took my tech exam, I had been hanging around the novice CW part of 40m long enough that I decided to take the 13 wpm "general" code test, just for ha-ha's. Imagine my surprise when I passed it! So it was back to the grindstone, studying for the written part of the general ticket. So it went. (Yawn)

My comment was not about no-code Hams, Einstein, it was about no-coders *associated with the telecommunications industry*, (just as I said in the original post - sorry about your lack of basic reading comprehension) that all the Ham magazines put forward at the time as being a great asset to the Ham community. - Then they turned out to be much like you, instead. What a let-down!

The GREAT majority of the worthless jerks I mentioned were and are, of course, tcpip buffs.

Everybody else knows that... I'm not surprised that YOU would like to pretend that you didn't know what I was talking about.

Watch your step, Steve; Get saucy with me again, and I'll start mentioning "your fellow Hams", and you know how uncomfortable THAT concept tends to make you feel!

;-)

Has anyone used the SCS PTC-II with WinAPRS?

I can get WinAPRS to read from the PTC-II, but every sentence begins with "2:fm W1xxx......" where 2: is the port in which I have the Packet board module installed in the PTC-II. WinAPRS thinks the station is 2:, not W1xxx and I can find neither a command within the PTC-II structure to suppress the port number output nor a filter file within WinAPRS to tell it to strip the first two characters received from the tnc.

Tnx, Tom K1TC

Thanks for reading my message. I have re-listed my Icom IC-737, Bidding starts at $2.00.

Icom IC-737 Mint Condition, If your the winning bidder, you will receive a beautiful General Coverage Rig, Mint cosmetically as well as electronically. Built-In Antenna Tuner, No Microphone. I do have a COPY of the owner's manual.

I try to personally check out each item I list for auction, and to describe each item completely & carefully. However, since most of these items are used electronic pieces all items are sold "as is". BUYER pays for all shipping and insurance.

Please contact me for any further information, other pictures are also available of this rig Contact ngwd@flash.net   Visit My Website at www.flash.net/~ngwd to see this and all the other items that I'm offering for bidding!

If you would like to BID on the HF rig, please click here.

Scott,

At this point, analog signals are still taking a narrower bandwidth than a digital signal. Commercial and government FM is already heading toward a narrower band FM, half the width of our current FM emission.

When it gets to ATV, well as other arguments on this forum have been talking about, 1200 is about as fast as our digital modes go. Maybe 56k, but not anything near the 6mHz or so required by MPEG.

As some have been mentioning, our data transfer capabilities are severely limiting our move to the digital world.

Ed

I suppose that depends on you mean by "moving to the digital world"...

If your concept includes Amateurs building digital systems of any significant size or distribution that are "competitive" with networks built, controlled and developed by governmental and commercial agencies, then I have a news flash for you; Hams will NEVER be able to effectively "compete" with entities which control resources of that type, level, and depth. - It will never happen. Forget it. Get real.

Hams do not have the physical resources to do so, and do not have the intellectual resources (funding, laboratories, equipment, personnel, universities, and so on) to "play" at anything approaching that level. - And they never will. This is simple reality.

On the other hand, Hams are in an excellent position to pursue technology and infrastructure that governmental and commercial entities have no interest in, and are not pursuing, themselves.

Traditionally, Hams have provided communications in those instances where governmental and commercial communications systems have broken down or have been pre-empted, because in these cases, "competition" simply does not exist. What we then have to offer is MUCH better than the alternative, which is nothing whatsoever.

Beyond that, Ham Radio communications are strictly a "hobby", and are done on a recreational basis. Again, "competition" with non-Ham communications does not enter the picture here. For most of Ham Radio's history, non-Ham communication systems have been faster, more reliable, and more generally useful than the recreational communications between Hams. There is nothing new about this. It is simple reality and is highly unlikely to ever change, for reasons that are obvious.

This is why Hams who do not worry about "the baud rate race" and concentrate instead on building up viable medium/slow speed infrastructure are so much more successful (within the pursuit of reasonable purposes, legitimate to the hobby) than the clique who insist that only "competitive" networking is worthwhile, and so end up achieving very little if anything. Their a vision of Ham Radio is only as a minor parasite, hanging off of the Internet's butt and completely dependent upon it in order to function at all. - And so by definition becoming useless in times of disaster or emergency.

Ham Radio digital networking does not need to be as fast as the Internet in order to be viable and functional, but it does need to be completely *independent* of the Internet.

The most crippling limitation that Hams are currently experiencing in their move into the digital world is the perception that we must somehow "compete" with governmental and commercial agencies that possess resources far beyond those available to Hams. Part of this crippling perception is the erroneous idea that we must compete in the "baud rate race".

So when you hear a Ham saying that we must use IP and "compete" in the baud rate race with the Internet, you can be sure that you are listening to the very attitude that has limited and discouraged the development of digital Amateur Radio, not one that has brought it forward or enhanced it's primary purposes; Alternate communications during times of emergency/disaster, and recreational communication among Hams so that independent infrastructure will be there when needed for that emergency use.

Charles,

I hate to say it, but you have a pathetic, defeatist attitude.

Amateur Radio has been known for years as creating and providing some of the major advances in RF technology. Amateurs have been on the forefront of most technological advances for many years. To say that we can't compete with the commercial agencies is just ridiculous. Look at APRS, many commercial entities are using the concepts that were pioneered in Amateur Radio to create position measurement systems.

And we don't have access to equipment and laboratories? Bull!!! Most laboratories are probably run by Amateur operators. Equipment? When we can't build it, we've always found ways to acquire it. If nothing else, in the surplus market.

I feel sorry of you who are staying in the analog world. Technology is passing you by. In not too many years you will find most if not all communications being conducted over digital modes. The FCC and the ARRL is already starting to work with software definable radios. Extremely complex communication protocols are already being implemented in $0.50 chips. Cell phones are costing very few dollars to manufacturer. Commercial radios are converting to digital. Nextel is putting the commercial two-way folks out of business.

As to your desire that Amateur Radio be complete segregated from the Internet.....
What a really STUPID concept. Anyone who knows how to create disaster resistant networks knows that you want as many connections as available. And it's also pretty stupid to separate ourselves from the rest of the world when it's the rest of the world that we are trying to help. Where would Amateur Radio be if we didn't do phone patches? Where would Amateur Radio be if it didn't use power from the commercial mains?

It's a pretty impressive thing to see two field day operators talking to each other during a disaster. Yep, two stations that can pass messages. But to whom? You have to interface to the rest of the world. You can't create islands.

To rely on the Internet completely is just as dumb, BUT, as you so eloquently put it, sometimes we just can't compete with the dollars of big business. And guess what, the dollars have created a really disaster resistant network that we might be able to use to assist us in doing our job. Remember that Arpanet/Internet was created as a disaster resistant

```
network with a lot of our tax dollars. Their is more routing redundancy in
the Internet then probably any other network, including the telephone
network.

Looks like the proper tense should be
"was" or "might have been" a Part 95 service ...

RM-9157

Adopted:  April  18, 2000
Released:  April 20, 2000

  ------

     3.  Section 95.601 is corrected by deleting reference to the "Multi-Use
Radio Service
(MURS) subpart  H" to read as follows:

     * * *  The Personal Radio Services are the GMRS (General Mobile Radio
Service) subpart A, the
Family Radio Service (FRS) subpart B, the R/C (Radio Control Radio Service)
subpart C, the CB (Citizens
Band Radio Service) subpart D, the Low Power Radio Service (LPRS) subpart G,
and the Medical Implant
Communications Service (MICS) subpart  I.

  ------

     5.  Section 95.605 is corrected by deleting the reference to "MURS" to
read as follows:

     Any entity may request certification for its transmitter when the
transmitter is used in the GMRS, R/C,
CB, IVDS, LPRS, or MICS following the procedures in part 2 of this chapter.
Medical implant transmitters
```

shall be tested for emissions and EIRP limit compliance while enclosed in a medium that simulates human body tissue in accordance with the procedures in Sec. 95.639(g). Frequency stability testing for MICS transmitters shall be performed over the temperature range set forth in Sec. 95.628.

------

10. Section 95.649 is revised by deleting the reference to "MURS" to read as follows:

No FRS, R/C, CB, LPRS, or MICS transmitter shall incorporate provisions for increasing its transmitter power to any level in excess of the limits specified in Sec. 95.639.

------

11. Section 95.651 is revised by deleting the reference to "a MURS unit" to read as follows:

All transmitters used in the Personal Radio Services must be crystal controlled, except an R/C station that transmits in the 26-27 MHz frequency band, a FRS unit, a LPRS unit, or a MICS transmitter.

1200 bps? Are you stuck in 1983 or something?

Let's look at the RFCs. When the main application protocols were designed, the target was existing dialup connections. e.g. smtp/pop3/nntp. Those connections were just moving from 300 baud links to the faster 1200 baud links, 1200 baud modems for home use were just becoming available (at $350 each), inter-computer links still mostly at Bell 202 or 64k leased line speeds.

Time frame is middle to late 1970's.

Guess why all those protocols are text based, are required to run over 7 bit connections, and have mostly very compact command definitions. They would run just fine over PACTOR-II links.

That's news and mail.

So what do you have in mind, that isn't news and mail or it's equivalent?

I'm not real sure of exactly what happened here. A lot of people got on the tcpip bus when it passed through here some years ago, but got off again just down the road.

> The fact that the usual (e.g. Windows, Mac) applications could
> not be used is one reason.

I think that would have helped keep people interested. And maybe even given a reason/excuse to improve the network.
The client software of the day was pretty spartan.
Server software doesn't really matter much.

> The difficulty of getting *NOS setup
> and running properly is another.

That wasn't a problem around here. We'd have generic set ups that only required a search and replace for things like callsign(s)and IP addresses. The rest can be fine tuned as the users learns about it.

> A Linux solution is not of
> interest to most hams.

It's not ready for the real world yet.

> The applications embeded into the various
> *NOS executables are either not easy to use, don't work well,

This is a real problem. As long as I don't use HTML or attachments I don't have any problems sending out packet messages using internet software (OE) and no one knows I'm using it unless I tell them.

>
> A different architecture is needed.

I like the use of ethrax25 for a client packet station. All it takes is a serial port, a KISS TNC and the ethrax25 software and you can run all your windows tcpip (internet) software on packet. You can make the windows aps as simple or complex as you like. Stuff like Oulook Express, Internet Explorer and Netscape are easier to set up for this than they are for typical dial up internet use.

I did it a bit different to that. I used a nul modem cable and linked it to a KISS port on my BPQ/JNOS computer. JNOS can act as an IP router and a way of getting mail to/from the BBS network onto the local tcpip network.
I could have have done it on one computer, but I like to have FBB and JNOS

running on their own computer and not on the one I use for running new (read sus) software.

Same here, but I don't need as many card slots and using serial ports works out a bit cheaper (but a lot slower) for me. Finding spare card slots are my biggest problem.

I'd like to see an interface option like ethrax25 for SNOS. The code is GPL and freely available. What I really want is JNOS with an interface to the windows tcpip stack. Then it would be sort of like Wingate and Mailtraq rolled into one, but with all the packet interface options.

>
> Are there any other solutions available?

Guess you knew I was going to say ethrax25.
To my way of thinking it offers the easiest way of getting windows end user client tcpip software onto the packet tcpip network.
All you have to do is install the driver, hook up your KISS mode TNC and config your software (that you're already using on the internet).

I've had a quick look at AGW, but only being able to use the tcpip side of it for 45 minute (without registering it) has put me off doing tests with it. Maybe one day.

I'm not sure what you are suggesting. Could you explain in a bit more
detail what that interface would be / do? As far as I'm aware, SNOS
and etherax25 have nothing at all in common, they do different things.
You could, perhaps, use etherax25 to connect your Winsock over
ham radio to another machine running SNOS ... and use a serial port
and TNC instead of that second ethernet controller :-)

> >

Not what SNOS is about ...

> All you have to do is install the driver, hook up your KISS mode TNC
> and config your software (that you're already using on the internet).

As far as I was aware, etherax25 allows you to stuff tcp/ip
out over a TNC. No services, nntp <-> bulletin translation, etc.
So it doesn't solve the most important issue: maintaining compatibility
with the existing packet network applications. SNOS my experiment
to do this: provide the bridge between the existing BBS network
protocols (e.g. forwarding) and the tcp/ip protocols (e.g. nntp
distribution).

> I've had a quick look at AGW, but only being able to use

DX-cluster and APRS are just that type of applications that can live with 1200 bit/s, in which messages are usually generated at so low rates that the link is idle between messages and there is only a small risk that queues are formed at one end of a link. Applications that by design require queueing (e.g. store and forward) destroy the responsiveness of any interactive applications, unless some QoS concept is used to prioritise the traffic by a frame by frame basis.

Applications similar to GSM cellular phone SMS (Short Message Service) or DX-cluster "talk" functions in which 1 .. 3 lines of text is

delivered in more or less real time so that an interactive discussion
can be maintained. But even in this case the link loading should be
kept low even during peak hours to maintain a usable response time at
these extremely slow half duplex links if more than one link is
involved in the transfer.

I have to go out in a minute so it won't be detailed.
I thought that SNOS used BPQEITHER to talk to the packet network via
another computer that has normal packet interfaces. Why not add a normal
packet
interface to SNOS.
Of course they have nothing in common. The idea of using ethrax25 is as
interface
option like bpqeither. To be used as well as or instead of it with SNOS.
If you have eithrax25 you don't need to connect to another SNOS computer,you
can connect to any *NOS computer over packet.
I just thought it would be a good interface to have as well as bpqeither.

Good isn't it. Why tie yourself down to one bit of packet software.
I use Mailtraq which does that and a lot more.

JNOS<>Mailtraq does that too, but you aren't tied to using them.

As usual, Hank is discussing in circles again. First he wants examples of
how TCP/IP applications can be used with packet radio, and once you give
them he starts talking oldfashioned packet radio protocols again!

Who would ever want this translation in the client software?
In a TCP/IP network, the clients are talking to corresponding services
on the network and server systems. Your BBS will be running INN and
sendmail (plus probably a POP3/IMAP server), no hamradio BBS stuff.

When there has to be any gatewaying, it will be done by the BBS system,
not the user software. Of course.

>Have you looked at SNOS to see what is needed?

I have never had a DOS-based system at home. Sorry.
My system is now running Linux, and I have NET running for the conversions.
I have not seen the need for anything different yet.

>> There was a painful gap between the introduction of Windows 95 and the

As others have noted, for the Internet market boxes like this are available
in many forms. And the software that would be needed in a TNC like this is
mostly available for free.
Integration to a product that can be sold may cost some money, and of
course it is easier to keep your customers dumb and not let them taste any
networking, or they will become hooked.

This worked well when the alternative was telephone BBSes, essentially the
same stuff as the packet radio system.
Too bad they then got the Internet, and saw the light. That meant the end
of telephone BBSes, and ultimately the end of packet radio as well.

That will be very expensive for them as well.

Rob

Hi All,
I'm a Fbb7.00g (dos) sysop and I'm looking for the latest satupdat.exe utility version 1.85e. The version that comes with Fbb7.00g is NOT y2k compliant.

I've looked everywhere...............comments appreciated.

Regards Chris, VK3VSW.

MURS may be a Part 95 service, but it's a splinter off of Part 90.
In any case, both Parts 90 and 95 have radio certification procedures
that amateur radio does not.

> > Anyway, you're apparently not aware of the better Part 15 services,

Given your promotion of 6 VHF sliver channels, I had to believe you were
ignorant of these.   I apologize.

Turnkey amateur radio operation in 900MHz and 2.4GHz? There's a flood of
Part 15 operation in those bands (my WaveLAN 900MHz network and Proxim 2.4GHz
network, and my 900MHz cordless telephones count) - but there is a dearth of
turnkey *amateur* equipment for these bands. I don't confuse the idea of
"amateurs
using Part 15 consumer gear" with "amateur operation".

I believe you either did not understand my comment or chose to ignore it.
My point, simply, is that the 2W power limit of MURS is already being flauted
by the scad of users that use modified amateur radios for Part 90 operation.
You're touting the power limit as an advantage and I'm noting that the power
limit holds little stength.

Agreed, there are some inexpensive FRS radios. However, these are extremely
simple radios without a connector for an external antenna or audio.

Well, I take it you haven't actually listened to the "color-dot" frequencies?
The FCC proposed the MURS to deal with the fact that unlicensed use of the
color-dot channels was far out of hand.

95.603 Certification required.

* * * * *

(g) Each Multi-Use Radio Service transmitter (a transmitter that
operates or is intended to operate in the MURS) must be certificated in
accordance with 90.203 of this chapter.

Oh, look at that. The proposed rules for MURS actually reference Part 90.
Am I wrong or were you ignorant of the rules, Stewart?

Rob, to make any such operation useful, things must interoperate.

> Who would ever want this translation in the client software?

Who was talking about client software?

> In a TCP/IP network, the clients are talking to corresponding services
> on the network and server systems. Your BBS will be running INN and
> sendmail (plus probably a POP3/IMAP server), no hamradio BBS stuff.

And how will it then interoperate with the existing services?
Without that interoperation, it won't work.

> When there has to be any gatewaying, it will be done by the BBS system,
> not the user software. Of course.

"the BBS system" ... "user software".
This is the same old song that we have heard for years.
Why must these be different things?

I didn't ask you whether you ran it, but whether you looked at it
to learn what problem it solved, and why.

So your claim is that NET/ROM is not "networking", APRS is not "networking",
DX cluster is not "networking"? Didn't think you were a tcp/ip bigot.

I think you should look at the web pages before you "think" too many
wrong things. SNOS has ax.25, NET/ROM, tcp/ip, can talk to TNCs
on serial ports, supports HAL P38 and PCI4000 controllers

> Of course they have nothing in common. The idea of using ethrax25 is as

Several "chat" applications have been available for about 10 years.
All I'm familiar with do what you mention above, and more.

You could have put that more simply:

TCP/IP over amateur radio never caught on because to properly set up a network requires COOPERATION by the participants - a trait that amateur radio licensees generally lack.

"Too many cooks spoil the broth."

For amateur radio, it's more like:

"TWO cooks spoil the broth."

Yes, that is a great solution. I have discussed with PA0HZP about a successor to the OptoPcScc card (we saw the problem of higher speeds and obsolescence of the ISA bus), and we have made some basic sketches of a single board using a Motorola 68EN360 that would do the above, but with an Ethernet interface to the PC or Mac or whatever.

Just standard IP-over-ethernet on the PC side, and standard AX.25 on the packet radio channels (3 channels up to 2 Mbit/s fullduplex on this chip).

One American packet equipment manufacturer was informally interested in reselling this.

We never continued this project because we believed there would not be many hams that would consider the cost acceptable (many even thought the SCC card was too expensive), and there would be too much risk in having the required PCB (at least 4, probably 6 layers) made in sensible batches, and not selling all of them.
Or having problems with the availability of the chip (very common problem with Motorola).

But later I have seen a German design that was essentially the same thing.
I don't know if they have made it into real availability.

Rob

19th Annual ARRL/TAPR Digital Communications Conference
Orlando, FL - September 22-24, 2000

** Final Update 9/18/2000 **

Counting down the final days until the 19th Annual ARRL/TAPR Digital Communications Conference this weekend in Orlando, Florida. For detailed information about the conference, please visit the official DCC web page at http:www.tapr.org/dcc.

Registration for the conference will be taken at the door. Friday registration is for an entire afternoon APRS activities, demonstrations, and presentations. Saturday registration includes conference proceedings, lunch, and a full day of presentations. Saturday night includes Banquet, dinner speaker, and prize drawing. Sunday registration is for the PICmicro Design seminar.

DCC Social:
Please join us Friday evening at 7:00 PM for a social get together time. The social is generously hosted by the Packet Radio Users Group of Japan (PRUG).

PRUG Presentation:
Friday night the Packet Radio Users Group of Japan will present talks on their progress on high-speed digital networks in Japan.

Saturday Night Banquet Speaker:
Mr. Doug Campbell, of Triton Network Systems (http://www.triton-network.com) will be our DCC Banquet Speaker. Triton Network Systems is located in Orlando, Florida.

Vice President Product Management, Marketing, & International Business as

Vice President of International Sales, Marketing and Product Management, Mr. Campbell leads the assessment of global community needs and spearheads the development of Triton Network Systems' product and marketing strategies.

Mr. Campbell cultivated his management skills in sales, marketing and product development working 17 years for Nortel Networks. While based in Singapore, he built a multifunctional pan-Asian team, which successfully captured a 100% market share with MCI-WorldCom Asia, successfully introducing a number of new products. Prior to this, Mr. Campbell was instrumental in the establishment of an SDH broadband equipment joint venture in China and served as a member of the company's Board of Directors.

Mr. Campbell received a Bachelor of Engineering Physics degree from the Royal Military College of Canada in Kingston, Canada, and a Master of Business Administration from IMD (University of Lausanne) in Switzerland.

Banquet Prize Drawings:
Grand Prize � Kenwood TM-D700A (donated by Kenwood)
2nd Grand Prize � Palm VII Personal Digital Assistant (donated by TAPR)
Two Motorola Oncore M12 GPS Evaluation Kits (donated by Synergy Systems, LLC)
Microchip PICSTART-PLUS PICmicro Programmer (donated by Microchip)

PIC Seminar Prize Drawing
Microchip MPLAB-ICD (donated by Microchip)

Project and Demonstration Room:
The DCC is a place where people can talk about their projects and gain ideas for new ones. The Project and Demonstration Room has become a recent DCC tradition where people can bring and display their projects. The room will be located next to the registration room and across the hall from the main presentation room. The Project and Demonstration Room will open at registration time and be closed (locked) 11:00 PM Friday and Saturday night.

Map and coordinates:
A map of the conference hotel and coordinates are available at
ftp://ftp.tapr.org/dcc/2000.dcc.hotel.map.pdf

Speakers:
The following is a list of presenters. PDF version available from
ftp://ftp.tapr.org/dcc/2000.dcc.speakers.pdf

Speaking schedule (subject to change) is available from
ftp://ftp.tapr.org/dcc/2000.dcc.schedule.pdf

APRS Seminar - Friday September 22, 2000

John Ackerman, N9UR	APRS WG
Steve Bible, N7HPR	T-238 Weather Station
John Blowsky, KB2SCS	APRS LOOKUP
Bob Bruninga, WB4APR	APRSdos, satellite, etc.
Steve Dimse, K4HG	Internet APRS
Walter Dunckel, KD6VYV	Serial Control of D7/D700
John Hansen, W2FS	KISS TNC, D700 Keyboard
Dale Huguley, KG5QD	Weather Server
Larry Gahagan, AB0JM	Wildfire Support
Byon Garranrant, N6BG	TinyTrack
Mike Musick, N0QBF	PalmAPRS/Tracker construction
Robert Osband, N4SCY	Public Service with APRS
Tom Schaefer, NY4I	APRS Email Gateway
Darryl Smith, VK2TDS	APRS in the 2000 Olympics
The Sprouls, WU2Z/KB2ICI	Mac/Win/XAPRS
Rob Wittner, KZ5RW	APRS-CE

Main Session, Paper Presentation - Saturday 23, 2000
Titles and abstracts are available at
http://www.tapr.org/tapr/html/Fcnc19.html

EasyTrak, A PIC Based Rotor/Radio Controller Interface
By Steve Bible N7HPR

APRS Tiny Web Pages
By Bob Bruninga WB4APR

Channel Capacity Simulation of Peer-to-Peer Spread Spectrum Satellite Transponders
By Matthew Ettus N2MJI

Correlation for Direct Sequence Spread Spectrum
By Panagiotis Gavalas

PIC-et Radio II: How to Receive AX.25 UI Frames Using Inexpensive PIC Microcontrollers
By John A. Hansen W2FS

Winlink 2000 ...A Global Ham Message Transfer and Deliver Network
By Hans Kessler N8PGR, Vic Poor W5SMM, Rick Muething KN6KZB, and Steve Waterman K4CJX

Frequency Offset Acquisition and Tracking Algorithms, Part 1 and Part 2

By Mohamed K. Nezami

APRS and the TAPR EasyTrak Az/El Rotor Control System
By Keith Sproul WU2Z

APRS and Kenwood TM-D700 Voice Messaging
By Keith Sproul WU2Z and Mark Sproul KB2ICI

Internet Wide Callsign Database using LDAP
By Mark Sproul KB2ICI

Automatic Voice Relay System
By Bob Bruninga WB4APR

Introductory Sessions - Saturday 23, 2000

Intro to Packet Radio
By John Ackerman, N8UR

Intro to APRS
By Guy Story, KC5QOI

Intro to Digital Satellites
By Barry Baines, WD4ASW

Into to HF Digital
TBD

Intro to Software Defined Radios
By Steve Bible, N7HPR

Thousands of Hams cooperated to build the AX25 packet network and HF
forwarding nets that the tcpip goons showed such intolerance about and
actively worked to undercut. - So your "theory" does not hold water.

You are just indulging in some of the very behavior I described...

"The constant insults and accusations directed against the general Ham
community didn't go over too well, either."

I guess that sort of behavior is so deeply ingrained that it has become a "knee jerk" or just plain "jerk" reaction by tcpip buffs such as yourself.

Thank you for the direct verification of my opinion. It's nice to be proved right.

The cost of writing software to do this is quite large, since essentially
none of the bits exist. Perhaps someone will take on this project.
SNOS, as I said, is an experiment in what such software might do.

> > > > As far as I'm aware, SNOS
> > > > and etherax25 have nothing at all in common, they do different things.

> list mail is on the internet) or even to a server like I'm running here.

SNOS is not a client.
It is middleware.
It has a client side and a server side, but it is not itself a client.
You could, of course, use it just for it's servers: smtp, nntp, ftp, http,
pop3.
It also has a client side, so it can talk to servers.
You might also call it "agentware" ;-)

You don't look at "the SNOS window", or type at it.
It links those things you are talking about together, so they work with
the existing ham radio network (BBS and tcp/ip). It could link most
anything: for example I use the pop3 client and server as a mail collector
and router. It can snarf up mail from my various pop3 accounts and from
the ham radio BBS network, I can then access it all from one place. It
knows how to route the outgoing smtp mail to the correct smtp server,
and the outgoing BBS mail to the correct BBS system.
Middleware. Both client and server.

That would be a very different program.

> But for now I get more features with less hardware with what I'm running.

Which features?

SNOS is not a BBS.

> Or does everyone have to use SNOS to be able to use, say, outlook express
> to get their mail.

SNOS is not a BBS.

> I tend to split packet (or internet for that matter) into two types- server

> and
> client. SNOS would be a good server if you had their hardware to run it.
> But I don't see it as a client solution.

SNOS is not a client. Sorry, I thought that was obvious. It's middleware.
Use any clients you like, for the appropriate protocols.

Low reserve. Bidding started at $90.

eBay auction of 2 Meter All Mode rig (covers 144-148 Mhz). Good to very
good condx. MC-46 Tone/VFO mic included.   It's great for autopatch, and
you can QSY right from the mic.

This is a mobile unit, and will, of course, require a power supply for base
operation.

Thanks & 73,

Chuck

X-Complaints-To: newsabuse@supernews.com

One of the projects I am working on (I just received a repeater freq
coordinated as a digital one) is to build a digital repeater.

What is a digital repeater?

Rather than FM voice modulation, the voice is sent through a CODEC
(A/D, D/A) and then through a vocoder to a digital compressed form.
The vocoder quality has been improving, and is now at the point
where users consider "good enough" at low baud rates. The current
vocoder by DVSI (www.dvsinc.com) operates from 2000 to 9600 bps,
with toll quality (phone/radio) at 4000 bps. Not only that, the vocoder
has FEC available. For example, a voice rate of 4000 bps can be selected

and 800 bps of FEC selected to provide a 4800 bps signal to the transmitter. I've selected 4800 as a candidate, because it is about the highest speed a voice channel can accept before internal modifications are required. I've selected Linux, because it offers experimentation at the least cost. Those with Microsoft subscriptions could easily go the same way with a Windows or Windows CE platform.

What good is this?

Digital voice that can be routed over IP offers enormous potential. Standard radio parts can be interfaced to a Linux box using a Soundcard to encode and decode the 4000 bps signal (4800 with FEC) and control the repeater through a Web interface. Once the digital voice is sent over IP, anything (linking) is possible.

Voice and data can be combined. The radio design offers a capability to use data to best effect. A small GPS engine can be combined with Callsign or other messages to be viewed in a small LCD window.
No need to identify every 10 minutes, you identify every transmission!
This also provides a very intelligent squelch! Don't like to listen to Jimbo on his way to work every morning? Put him in your killfile and the radio stays quiet... A repeater could easily show who is in range, if radios sent out APRS type packets with their callsign and position.
OK, I'm dreaming (nightmare), but you get the idea...

What kind of experiences have people had with 4800 bps with typical Ham radios?

Best Regards,
Steve/k5okc

With my answer he can fish, with yours he only gets one meal.

Since most new IP enthusiasts only last a few days, I generally just
recommend they pick any IP address above 64 in their states octet,
as those addresses are not coordinated in the U.S.

I'm suggesting that SNOS should be able to talk directly to the Windows
TCPIP stack rather than having to go out one NIC and back in via another
one.
Just like all the internet software I know of does.

> > > As far as I'm aware, SNOS
> > > and etherax25 have nothing at all in common, they do different things.

That's right, more or less.

> > > You could, perhaps, use etherax25 to connect your Winsock over
> > > ham radio to another machine running SNOS ... and use a serial port
> > > and TNC instead of that second ethernet controller :-)

Yes. For a user (client) all that's needed is ethrax25 and a serial port
and
they are surfing the packet radio net in a matter of minutes and a few
reboots.

It doesn't have to be SNOS, it could be *NOS for private mail and bulletins
that have been through rewrite and alias (so that bulls end up like mailing
list mail is on the internet) or even to a server like I'm running here.

> >
> > I have to go out in a minute so it won't be detailed.

> on serial ports, supports HAL P38 and PCI4000 controllers

I have actually downloaded SNOS a couple of times. It seems to offer more
now than when I last looked at it.
I'm sure in the past it wouldn't run without bpqether and there seems to be
more features now. If I had a couple of spare card slots and NICs I would
be temped to give it another look. If it talked directly to the Windows
tcpip
stack and to BPQ via a loopback port I'd be running it now.
But for now I get more features with less hardware with what I'm running.

> > >
> > > Not what SNOS is about ...

OK, then how do end users get their mail and bulls from your SNOS server.
Or does everyone have to use SNOS to be able to use, say, outlook express
to get their mail.
I tend to split packet (or internet for that matter) into two types- server
and
client. SNOS would be a good server if you had their hardware to run it.
But I don't see it as a client solution.

And mailing lists and you can get your mail with a browser if you were
silly enough. The remote logging is handy. It's all compatable with the
existing packet nertwork or I wouldn't be using it.

I might have a look on my next lot of days off if it's not good fishing
weather.
I've got it installed on this computer with one TNC cofigured. I just
haven't
looked at the tcpip side of it.

The simple answer (which Steve could have provided, but he's lazy):

Contact KD1CA. If you can't get hold of him,
send an email to brian@ucsd.edu asking for help.

I think it is rude to suggest bothering brian for things that can be solved by simple FTP.

I already posted the URL: ftp://ftp.ucsd.edu/hamradio/amprnets

Apparently mister HAM did not read that or he killfiled me. Too bad.

Rob

>Rob, to make any such operation useful, things must interoperate.

But no software is required in the client PC to do that.
I get my mail forwarded in SMTP from the local F6FBB BBS and I reply to
it using a mailer that sends it back in SMTP. The conversion is done in
the BBS.

>> Who would ever want this translation in the client software?

>Who was talking about client software?

You wanted to have client software to run TCP/IP on amateur packet.
Server software has not been a problem for a long time.

>> In a TCP/IP network, the clients are talking to corresponding services
>> on the network and server systems. Your BBS will be running INN and
>> sendmail (plus probably a POP3/IMAP server), no hamradio BBS stuff.

>And how will it then interoperate with the existing services?
>Without that interoperation, it won't work.

Why would I tell you? You will have further comments and remarks about
how unusable or non-USA these solutions are.

>> When there has to be any gatewaying, it will be done by the BBS system,
>> not the user software. Of course.

>"the BBS system" ... "user software".
>This is the same old song that we have heard for years.
>Why must these be different things?

Because the average user is not interested in running his own BBS.
He wants to fire up the system and work. No configuration and maintenance.

Look at the Internet: 99.9999% of the users aren't running any services at all. They just connect to their provider who runs all the services.

>> >Have you looked at SNOS to see what is needed?

>> I have never had a DOS-based system at home. Sorry.
>> My system is now running Linux, and I have NET running for the conversions.
>> I have not seen the need for anything different yet.

>I didn't ask you whether you ran it, but whether you looked at it
>to learn what problem it solved, and why.

You have discussed that many times.

>So your claim is that NET/ROM is not "networking", APRS is not "networking",
>DX cluster is not "networking"? Didn't think you were a tcp/ip bigot.

NET/ROM provides no networking in the sense that IP does.
In a network, each station has a unique address that can be looked up, and used to make connections to it. With NET/ROM, there are additional addresses involved (endnode callsigns) that no service in the network will provide to the user.
Flexnet is slightly better in that it allows to "locate" a peer that is at an unknown endnode, but worse in that it does not distribute any information about the nodes themselves (so that the user cannot guess which node will be near to the user, based on city name etc)

It is this addressing layer that is so painfully missing in AX.25 "networking". When I want to connect to W0RLI, I first have to investigate where he lives, how the network surrounding him is structured, and at which of the nearby nodes he is QRV. That probably involves a BBS message or even a phonecall.

When I want to FTP to ftp.ucsd.edu, I don't need any of this info. I ask the IP address and send off my connect request.

That is the big difference between NET/ROM (or Flexnet, Rose for that matter) and IP.

Rob

I assume you mean GMSK ?

I have had reasonably good results using PI/4 offset DQPSK to
transmit digital voice using a FT290R 2m SSB radio, that was
at 3600 bps, 2400 voice - 1200 FEC. Best DX so far was 70 Km
over an obstructed path and flat conditions.

You can run those AMBE chips at 1/2 their lowest datarate by
throwing away every other frame on transmit and feeding each frame
in twice on receive. The speech quality is not bad at 1200 bps, but
at 600 bps it is awful.

A lot of the very lowrate rate vocoder do something similar, they interpolate the Line Spectral Pairs (LSPs).

One scheme I saw sent the Pitch and magnitude on each frame but the LSPs on every other frame and a quality bit to indicate whether the missing LSPs were more similar to the ones before or the ones after the missing ones then used interpolation to fill in.

Also because certain parameters in speech change in a fairly predictable way it is possible to use zero overhead error correction. For example the pitch frequency usually does not change more than about 10% per frame therefore if the receiver suddenly sees a rapid change in pitch it is likely due to a bit error.

There is a lot to speech coding and Vocoders that are used over the Internet are not normally ideal for highly errored radio channels.

Still it is fun writing ones own Vocoder, you certainly learn to have respect for people that do it for a living!

You are much advanced in your thinking. One of the papers you have to do in signal processing, is a speech compression paper, but most people think in terms of voice quality when doing their paper. I know the LPC stuff sounds terrible, but you do get the message across. There is something to be said about a Q5 signal in normal use, but when "it has to be there on time" and Q2 will do, well then - slash and burn, interpolate, extrapolate... :-)

Not really... you can do that with MP3 files as well.  The MP3 player I am
using has options to control such omission and re-playing, and it can even
be used to do primitive pitch shifting.

Many of the US coordinators are no longer active, do not reply
to requests or can no longer be found at all. This is the situation,
for example, in 44.26. What should one do in that case, other
than "bother Brian". I think it is quite rude to give someone only
partial and incomplete information.

Rebuild your kernel with sound modem support. It works well.
Read the AX25-HOWTO and HAM-HOWTO files.

Newer config scripts have a blanket Ham Radio Support option
that suppresses all ham radio-related configuration items.
You must say Yes to get them.

Yea! but is their an APRS program to run APRS in Linux *and* via
soundcard? Does Xaster or whatever do it?

What are the pros and cons compared to WinAPRS?

Yes I do it! FlexNet works solid but needs setting up in DOS first. I can't find an APRS program (yet) for it though.

AGW works for some and we're expecting a new version 2000.72 any miniute. It is easy and works in Windose and prefers 98.

Don't forget I'm talking SOUNDCARD Flex, AGW and Linux. They all can be used with a TNC (normaly) and require less processor requirements and may run with more software. But the software is coming along nicely for soundcard packet. The next version of AGW promises two ports from the L and R soundcard channels!

Translation: Your soundcard is now capable of being two 9600/1200 TNC's (That is, two port). More baud rate choices too. Do you have an old "true FM" rig that's easy to tap into for 9600?

Can you say free (what you have) wireless 9600 baud network? Now 9600 don't sound so bad do it? TCP/IP anyone? Stick that in your cellular "wirless-web". :) This Inovation can play a big part in keeping our bands!

Hams do it mobile. :)

Programs like AGW Packet engine 2000.72 now allow your Pentuim + soundcards to take the place of TWO 9600/1200 TNC's! Combined with a easy to tap into "true FM" rig you can do 9600. 1200 baud requires no modification.

Can you say new and free (with what you may have) 9600 baud network?

Could this revive Packet?

9600 is fast enough for TCP/IP and is wireless. One can use your regular Internet programs. FTP, HTTP, Newsgroups, Telnet ect.

Can you think of some real benefits from this?

Sure, work on faster but don't forget the cost!

Further if you don't think this is in the "spirit" of ham radio or something then simply go and do what you will. Just don't dictate what I do. TO EACH HIS OWN!

Stop the bickering. You'll make us all look bad. If you want to do only CW then I GOT NO PROBLEM WITH THAT! Just mind your own business and don't rain on my parade. I think it's wise to combine various mode/bands whatever for a communication benefit. If we don't focus on some benefits ham radio will soon be sold off.

So I hope you get my point. Don't turn this news into a bar brawl. I hope I'm clear. If you don't want to do anything but RF or CW or Internet or whatever then fine. I HAVE NO PROBLEM WITH THAT! That's OK. I am simply on a quest for benefits. Benefits for emergency, benefits for everyday. Ask yourself; when the fun (of tinkering) is over, what's left?

Plus! While this is a technical hobby, let's not fail to distill THE TECH down (EASY OF USE) so new hams and the not so technical can benefit form it AND GET STARTED. After all guys, intelligence isn't that big a deal compared to communication and caring. Let's stop trying to prove how smart we are and get down to business.

Sorry for the rant. I've just seen too many "bar brawls" when someone tries to promote a real benefit in Ham Radio. What can you say about the soundcard "revival"?

73
God bless
Be well

For Auction on Ebay:

PC Computer System built in a high quality tower case with an Intel Pentium OverDrive 200MMX CPU, Intel Advanced/EV Motherboard with built-in Sound Blaster-16 Sound!, 64MB RAM, 3GB Western Digital Hard Drive, 3.5" Floppy

Disk Drive, 16X CD-ROM Drive, Parallel Printer Port, Two RS-232 Serial Ports, Matrox Mystique, 64-bit, PCI 3D Accelerator Video Card, and 101-Key Keyboard. (no monitor, no mouse) As you can see, this is a very clean system, and everything works! Microsoft Windows 3.x/95/98 compatible! This would also make an ideal LINUX system for your home network, firewall, router, etc!

This system would be excellent for your computer programmable/controllable radio equipment, as well as running all those data modem applications!

Just a little over one day left, and currently going at only $77.51, with no reserve!

Thanks,
Bill Crocker
Warren, MI

That's cool.

Even with a true FM rig, your TxDelay will be so high that you will not
be very happy with your results. Think about getting a TEKK data
radio. They are cheap, and they work.

Thank you for the help. It was nice of you.

What trans delay do I need? About what speed in ms, I mean? It seems
most fairly new rigs are quick. Let me find a spec. Didn't find it but
I think it's about 200ms.

Thanks

Will there be inforcement of that limit, then?

We have many licensing systems with a power limit here, including MARC (CB), LPD (lowpower on 70cm), Amateur radio. The most interesting activity for many users seems to be to output more power than allowed and not being caught doing it.

(not difficult, because the administration is not very interested in enforcing the limits. the only exception being Amateur radio, where license limits are only enforced opon those that the radio society's

big bosses don't like. when they call the authorities, immediate action
usually follows)

Hi All,

I just bought this unit and installed the software that came with it. The
included software (PlusTerm) doesn't seem to be great but it probably works
for most people. However, in my case, I need to run the software from an
IBM ThinkPad 600X which sets the COM port to 5 and PlusTerm says that this
is an invalid port.

There must be a good Windows program out there (FREE or reasonably priced)
to control this great box. From what I hear this is a very good MPC that is
not well represented by the software bundled with it.

Thank you in advance!

Carlos

Just a quick note guys to say that there is a new release of Mako sans software for RTTY. It has supporting help files in English which have been compiled by the help group headed by Jan KX2A.

The software is fantastic, and if you have never tried it give it a whirl.

The file on my download page is for pentium use.

http://www.g3vfp.co.uk

Hope you enjoy it.

So CLOVER FEC would work ok for that use.

The issue is how to find the 10-15 stations interested in setting up and network and playing with the protocols. For the original packet network, it took me more than 9 months, and many hundreds of phone calls and letters to get things going. Once the first 5 or 6 were signed up, and the protocol was finalized, it got a bit easier since they helped recruit more stations :-) I'm not interested in doing that again ...

But my comment was about today! (Keep this in mind ...)

> "NOS" was just the name of a certain version of "NET" that had a modified
> internal structure so that the interface between "applications" and
> "kernel" more resembled the BSD socket interface, but it was never
> separated into a kernel and applications at the distribution (executable)
> level. All the applications had to be compiled and linked with the kernel.

That is true if one assumes the applications and NET (or NOS) were running on the same machine. I always ran NET and NOS on it's own machine, thus providing access to the ham radio network to other machines running the same, or some other, OS. Then you have any and all networked applications able to run native, and run over ham radio via the NET (NOS) "gateway to Ham Radio" machine.

This also has useful firewall implications.

> The result was a very large number of different "NOS" versions, each extended in some direction to include applications the particular maintainer liked, and with a stability reflecting the programming quality of that particular maintainer. You know, being sloppy with memory allocation or pointer handling just made the program leak memory or crash for other reasons, killing your entire station.

This was the failure of the tcp/ip coders. They somehow missed, or did not consider, the obvious solution: partition the problem onto more than one machine
Cost is not an issue since NET (NOS) can run on any old junker when it does not have to bind all the "applications" into itself.

> It took until 1992 for freely available Unix-like systems to come on the market (I installed my first Linux system in december 1992), and THAT was something that would have been nice to have in the early NET/NOS days.
> (the first NET version was released in 1985)

It was available in late 1984 if you lived near Phil ...

> Now you could independently develop and run applications in separate processes, and have them crash independently. Plus existing applications could be used with packet radio without having to adapt them into the NOS environment. This was a big win, but it was too late.

And the model was still really tasks inside one process. The support for running under DV never did seem to work right, OS/2 never caught on, and doing things in Win 3.1 didn't seem to work right either.

> Most die-hard NOS users would not part with their system, learn Unix/Linux, buy a better (at least 386) system to run it on, etc.

Junker 286 became "free" or "nearly free" by the 1990 time frame.
I was giving them away as we junked 'em out at work then.
In any case, NET (NOS) could be run on XTs, which were very available for free or near free a year or two earlier.

> (I am not counting the happy few that had an old 3B2 from work, to have a decent user population one needs to use hardware that anyone can get)

> Of course it became worse when Windows 95 finally appeared and all the hams went using that OS, for which usable interfaces between IP and packet radio did not appear for several years. The only "solution" was a separate box

> connected to a shack ethernet and running some router software (NOS, for example). This was just a too complicated solution when one could also run a packet terminal program interfacing with a TNC directly connected to the Windows box. The BBS user did not see any advantage of a network protocol anyway, as his connection is point-to-point over a local link.

> The really attractive applications only got widespread with the introduction of Internet in the general consumer market (around 1997, 1998) and by then the amateur packet network was already losing its most active proponents.

Approx 1992 is closer to the key year. Initial version of Mosaic was available then, many email clients were available, newsreaders had become robust. Even earlier all this could be done using WFW 3.11. But see further comments below: if one used email and netnews, one was divorced from the existing BBS network.

Development stayed stuck in the "monolithic single process" model, and had not yet begun to move toward network computing. Maybe if a few folks from Sun had been involved in the Ham Radio work things would have turned out differently.

> So, it is not fair to say there was never a lack of applications and than anything that runs over TCP/IP works. It does now, but it did'nt back then!

Well ... it *did* but the folks involved with *NOS (JNOS, WNOS, WAMPUS, et al) seemed stuck in the "monolithic single image" mode.

There was a lack of consideration of other system architectures, which continues to this day. SNOS exists simply to demonstrate that it is easy to solve the problem: it doesn't have any "applications" bound in to it's code, it just does the networking and protocol translations. Protocol translations: nntp <-> bulletins, smtp/pop3 <-> personal messages.

At the time that the NET -> NOS transitions took place, I was pretty much out of the loop, being very busy doing a startup and then moving from CA to OR. Wasn't paying much attention to ham radio again until after Johan moved to Japan and the JNOS project was over.

I do the same here, plus one additional thing: I'm sending this across
a ham radio link, from one Windows 98SE system to another,
and thence onto the internet. It can work both ways: ham radio
data over the internet, an internet connection routed over ham
radio. Both are easy.

That's the problem with using CLOVER for this purpose... There are few owners of CLOVER equipment who would be interested in going into "receive only" mode for an extended period of time. If somebody came up with a soundcard compatible CLOVER monitoring program (especially if it worked in DOS) then you would have a much easier time getting volunteers.

Cathryn's suggestion of using PSK31 sounds much more likely to succeed, for that reason. There are already hundreds of PSK31 stations out there, and nobody had to invest big bucks to get any of them up and running. With a much larger user base to work with, your chances of assembling a decent startup group rise proportionately.

Multicast's efficiency is directly related to the number of receiving stations per transmitter. Anything that drives up the number of receiving stations also drives up multicast's efficiency and utility.

Stick with @WW bulletins. If you start adding lots of nonessential "goodies", you are throwing away valuable update time and reducing your ability to move the @WW traffic. Once it's established that you are moving @WW really well, that would be the time to consider adding or not adding additional content. Remember that a LandLine Lids' favorite way to undermine legitimate digital efforts by Hams is to insist upon jacking up the content level until the system is hopelessly overloaded. - THAT's why the @WW "problem" got out of hand in the first place! - So stick with @WW only, despite inevitable pressure from various LandLine Lid types to do otherwise.

Lots of folks might be interested. Let's see if any actually are.

There is a lot more code to write to use PSK31. For CLOVER almost
all the needed code exists, and at least one author has indicated an interest.

> Multicast's efficiency is directly related to the number of receiving

Yes.

Using CLOVER FEC, there should not be much problem handling
everything that is available to handle. I'm doing it now in ARQ mode,
to 5 different stations. Some of them might be interested.

You have any interest in Ham Radio Steve?

Want to take part in some HF multicast experiments?

Would CLOVER or PACTOR (or AMTOR for that matter)
FEC be a good way to go?

"Hank Oredson" says:

> You have any interest in Ham Radio Steve?

Yes. But WW BBS has no merit, technically or socially. So if that is the end product, you have cheated the public in their allocations to us.

> Want to take part in some HF multicast experiments?
>
> Would CLOVER or PACTOR (or AMTOR for that matter)
> FEC be a good way to go?

I agree with Cathryn that PSK31 is the proper way to go. The software and hardware are endemic to the digital part of the hobby.

Not only that, but a fine Windows DLL is available to use for the low level part: http://www.qsl.net/ae4jy/pskcoredll.htm by AE4JY.

One thing to keep in mind, is that most computers can decode multiple PSK31 signals with CPU to spare. Thus, you could use diversity reception/transmission, rather than FEC.

Now comes the hard part. Everyone want to have their callsign in the header, so who gets elected transmit operators? If Elmer gets pissed off, he will start his own group just to see his callsign in every message.

I think there should be a dramatic change in the mail header. The mail header does NOT need to show the path. A mail header that is longer than the mail message is unproductive.

What may occur, is that a station in Seattle may transmit all day, and a station in Phoenix picks this up. It send this via VHF/UHF to a buddy across town who transmits all day and night, which is picked up by a station in Montana who hears both of the stations all day, who sends this to a buddy across town... etc, etc.

Let us propose to kill any header ideas of the past, and rethink that issue. This is not a network that can be traversed forward

and backward. The path means nothing. What kind of mail header
should there be?

Off the top of my head, I would think a generic part of the standard
email header would be enough. Adopting the state.ham.us or
province.ham.ck would add some sort of routing by country
capability. I don't think ampr.org is a viable tool any longer.

There you go, bark! at that Chuckles...

Carlos -

Try AirMail2000 (www.airmail2000.com). It supports COM1-COM8 and
works nicely with the SCS PTC-II's (along with a lot of others - Jim just
added DXP38 support). Also has some rig control capability.
It is a dynamite application and free!

73's - john N3SKO/AAT3BF

I disagree on the protocol. UDP only supports one data packet in each
direction (as in a query and response) before closing the connection. TCP is
what is needed as it can send a session (or a group of packets bidirectionally)
before closing.

I am deeply disappointed to warn you not to deal with Warren Brooks W4WWB.
He advertised a radio on ebay that was complete, but needed some work. What
arrived was a parts radio - Pieces were missing and it will not power up.
After he ignored my emails I contacted him by phone and in his best good ole
boy drawl he told me " you bought it, you own it". He would not allow me to
return it for a refund. I know that ebay is a take your own risk venture -
but deliberately lying about the condition of the radio to sell it is
dishonest. What a disgrace to the ham community. Don't be suckered by this
man like I was.

I believe you're mistaken. UDP is an unreliable datagram service that makes use of IP fragmentation and reassembly. You can open a UDP socket (there's no connection to speak of, just an end-point for the demultiplexing) and send as many frames as you'd like.

It's not transaction based like you describe, at least not at the protocol level. There may be implementations of UDP APIs that are broken, of course.

In simple terms, TCP is a connection oriented protocol that is reliable. You
would
want to use this for reliable things like a database connection, Telnet, etc.

UDP is a connectionless oriented protocol for things like audio and video.
It doesn't do much more than provide ports and checksum to the IP protocol.
TFTP (Trivial File Transfer Protocol) and NFS (Network File System) were two
early protocols that rode on UDP. Not because the were unreliable, but because
they were used on an Ethernet LAN where data loss was statistically low.
Have you ever done NFS across the Internet? Bad, I know. Recent
implementations (Ver 3) allow you to specify TCP for NFS.

I'll go along with that. If you can do it on the internet, you can do it
on the packet radio network.
I'm using mailtrax (a windows based internet server) as an smtp and
nntp server for my packet mail and bulls. And I use outlook express
to read/send all my packet mail/bulls. I've got it set up for 2 packet
accounts and 4 internet acounts and a packet news server and an
internet news server.
I've started a bit of a page of what I'm doing, here -
http://www.qsl.net/vk3bvp/ethrax25.htm
It's a bit pathetic at the moment, but I will get around to doing it up
a bit.
Anyway that's just one of the things I'm doing with tcp/ip at the moment.
And of course you can do it all with linux as well.
The important thing is to have fun doing it :-)

OK - but all the applications that I have seen which use UDP are either of the
query/response type (such as DNS) or of the unsolicited information type (such
as for dynamic routing). I've never seen nor heard of an application which
takes multiple packets. I thought UDP opens a socket but NOT a stream like TCP
does. If one wants to create a virtual stream with UDP, it's possible, but
that requires that such be designed into the data structure being transferred.

TCP already handles that intrinsically, but UDP [by itself] doesn't.

I did look into multi-cast a bit. And, the funny thing is I think it would be very well suited to transmitting APRS data across the country. The issues seem to be...

1. Most of the new multi-cast work seems to be with IPV6, and not old IPV4 multicast. So, I'm not sure how well all the code is maintained. (This is just a perception of mine, so maybe I'm wrong here.)

2. Windows and Linux both support multicast. However, you need a Unix machine of some kind to run 'mrouted' which allows you to tunnel between parts of the net which don't support multicast.

3. But, yes you can run multicast routers on your local LAN, and

then link to other people also running multicast routers. And somehow, when you send broadcast packets, the routers are supposed to figure out somehow how to get the bytes from here to there.

4. The application programming API for multicast is super simple and easy to understand. Writing code is no big deal.

5. Multicast doesn't guarantee delivery. It's more like UDP than TCP/IP.

6. I believe mrouted is supposed to be smart enough only to route the packets to those who want to hear them. So, if say, you wanted to hear all the APRS packets in New York City, but you were in Las Vegas, somehow, mrouted would get that data to you. I have no idea how well this works. Supossedly there was a network one time running ip multicast called the mbone -- but I can't find many references to it lately.

7. Obviously there is zero code for any of this right now. Somebody would have to do some programming to put all this together.

You cannot know everything. But NFS is such an application. It uses UDP to send data between two systems that have a session in the sense that one knows about a filesystem on the other, and opens and closes files on it. But there is no real session as in TCP, and the server system can be rebooted between client requests without losing anything.

Multicast is on the IP level.  UDP can be used with multicast, TCP cannot.
Because TCP assumes it is talking to a peer that will send it
acknowledgments, that confirm the reception of sent data (which can then
be deleted from a queue).  This isn't the case with multicast because one
receiver may miss data that another one got.

In the case of TFTP, it might be that TCP hadn't been fully invented yet when TFTP was specified, but I'm too lazy to look it up.

The reasoning behind NFS was that the overhead of TCP connections would needlessly impact performance, so NFS ran on top of UDP with a homegrown reliable protocol that wasn't very sophisticated. With V3 came NFS/TCP, which is indeed much better. Keep in mind NFS is also stateless, so a stateless transport like UDP perhaps seemed to more sense early on.

Rob,

I think my observations are right on target. There are perhaps several reasons tcp/ip over ham radio has not become popular. The fact that the usual (e.g. Windows, Mac) applications could not be used is one reason. The difficulty of getting *NOS setup and running properly is another. A Linux solution is not of interest to most hams. The applications embeded into the various *NOS executables are either not easy to use, don't work well, or do not exist at all. One expects, for example, to click on a file and attach it to an email message.

A different architecture is needed.

Win95 and Win98 with both run virtual DOS machines. They work just as well as real DOS machines to run NOS as an interface/gateway etc. Just takes a second ethernet controller. This machine is running that configuration. Ethernet controller cost me $7 at Frys a few months back. Now I don't have the problem of "all applications must be bound into the NOS memory image." All the usual Windows applictions work over ham radio tcp/ip AND over ham radio BBS links.

Your comment applies to Unix solutions as well: very few hams are interested in running Unix, other than a few nerds.

To get hams to use tcp/ip there needs to be a better solution than either of these. It must be simple to install and simple to configure and simple to use. It must run in Windows. SNOS is an experiment in that direction.

Are there any other solutions available?

NcWinPTC is free, and works very well with the SCS PTC-II and IIe.
Another super Windows based program for the PTCII/IIe is XPWin. There
is a fully-functional demo version available for download. Links for
both programs are on the SCS Website. I have used both programs and
both are excellent.

Yes, at least two of them. From SV1AGW and from the Flexnet group. These don't need the hackery you propose, they just implement a network interface that runs packet protocols (just like the Linux solution).

They are available for about two years now, but they came too late to leverage (popular buzzword) the initial developments in amateur TCP/IP into the average-ham shack.

There was a painful gap between the introduction of Windows 95 and the usability of its TCP/IP networking on amateur packet radio. One would have expected the TNC manufacturers to step in with a TNC with modified firmware to provide a PPP interface on the ASYNC end while running IP over AX.25 on the radio. Then, it would have been possible to use the standard dialup networking of Windows 95 with amateur radio, with the addition of only a small control-panel program to perform some settings of the TNC.

But no, they all seemed to be glued to KISS and Hostmode.

Have looked at both.

Did not see how they handled the nntp <-> bulletin
and smtp/pop3 <-> personal message translations.

Perhaps I missed this. Will check them out again, it has been a year or so since I last looked at them. Flexnet was not an option for me since I have no TNCs that could support 6PACK. I could not figure out how to make the SV1AGW stuff do what is needed.

One $7 ethernet controller is a lot cheaper than replacing a half-dozen TNCs.

Have you looked at SNOS to see what is needed?

There is a good deal more required. We are in complete agreement of course on the direction taken by the TNC manufacturers. I've talked to two of them, and their response was essentially that making changes like this is very expensive (I agree) and that there is little market pressure to make those changes (I also agree).

> But no, they all seemed to be glued to KISS and Hostmode.

We are stuck with what is available in the TNCs. This should not stop us from doing interesting things, it just makes the problem "more interesting."

I've been running a Linksys router for about 2 months now. That's really the way devices need to arrive these days. It plugs into the WAN on one end, the LAN on the other, and is configured with a Web page.

Web interfaces have been done before (My Hawking iRouter did the same thing for the same price, but only with modems). Cisco did it a long time ago (but who the heck cares at their prices).

Cheap, and needs to do the job.

That's really how Ham gear must be designed today. If it has a Web interface, it will sell like hot cakes (just ask Linksys, and Hawking) :-)

I haven't opened up my Linksys yet, but I'm dying to see if it is a modern CPU.

At least one manufacturer of controllers for digital ham radio
has this under consideration. I would sure like a PACTOR and
CLOVER (and etc.) HF modem with an ethernet port instead
of serial port.

> That's really how Ham gear must be designed today. If it has a Web

Thus the experiments with web based remote admin in SNOS.
The idea works fine. Needs a lot of code to do everything needed.

Probably not a Z-80 or 6502/7/9 :-)

Have you ever heard of the MCB-152? Yes, some Europeans actually do some development from time to time :-) The MCB-152 is a general-purpose micro-controller board (based on a special Intel 80c152 microcontroller with special communication gear on board). Our first firmware project was the KISS-firmware (just to get the toy usable). Next, the SLIP firmware was developed (now going into its third revision). What makes this SLIP firmware so special is that it behaves as an ordinary telephone modem (AT command set) towards the modem and applies classic Packet-Radio to its radio-port. Result: you can simply use the generic modem driver that comes with your OS (Win9x, NT,

W2K, Linux, MacOS, ...). You setup a dialup connection like you do to reach your ISP and there you go! No proprietary drivers to install, no tedious configuration (you already have done it once to get connected to the Internet), what more could you ask for?
You could have a look at our generic project page at http://www.qsl.net/on1blu. From there you will also find links to the MCB-152 project page and the like.
Our opinion is: users should be able to recuperate their genuine Internet software to travel the ampr.org network, for servers we prefer Linux (since it's free, of course). To help new SysOps, we developed a step-by-step course and provide all our own configuration files as a sample (freely available from the website mentioned above).

I'm using the AGWPE on APRS and it is kind of neat to interface with. Right now I have an application that connects to the AGW server on its port 8000 and feeds the data into a MySQL database (just now working on the mysql database interface and table design). I think the limitation of AGW is that if you want to use TCP/IP on the radio port, you must have some other means to get to other networks such as ROSE, NETROM, etc. That is, it only talks to things it can ARP with, if I'm not mistaken.

While the AGW interface is kind of neat, I will be switching to the aprsd I/O code to feed my database in the interest of speed, and a one machine solution.

Oh well...

"Rob Janssen" says:

> Yes, at least two of them. From SV1AGW and from the Flexnet group.
> These don't need the hackery you propose, they just implement a network
> interface that runs packet protocols (just like the Linux solution).

Has anyone successfully convinced PakRatt 2.0 for Windows to ru on a w95osr2 system??
It worked on my old PC which was a 486 and has original w95, but an having a H*** of a time trying to get it right on this new PC......AMD k6-166...old shack machuine died, so replaced it with the older big machine.....that way the kids get this shiny new HP.....

Either that or a suggestion for new dual port software.......

PakRatt 2.0 has Y2k issues as well as it wasn't 32 bit aware. We purchased
the source code to it back in March of 1999 and made the fixes.

You can update to Pakratt 2.1 for $30 or up to Pkterm '99 from PakRatt for
$50. Pkterm '99 is full 32 bit and will run on all 32 bit version of
Windows, include Windows Me and 2000

http://www.cssincorp.com/pkterm

Does anyone know if there is a chipset produced that can make up a
short range link for rudimentary status monitoring of a subject
device? It would need to implement some sort of auto negotiation so it
could co-exist independantly with other identical device pairs.
Thanks.

Well Swamprat,

I suppose you never heard about great land deals in Florida?
If you don't have the money to risk, why gamble?

We're only hearing one side of the story, and it's not like you're
a regular on here.  You could be a spammer, probably are, as
no one could be so stupid to send $302 in the mail for a
radio "that needs work."

If it sounds too good to be true, it probably is.
```

```
P.S. Look both ways before crossing the street!  I don't think
your momma taught you anything.

I'm sorry, but I have to disagree with all of the stated opinions as to why amateur tcpip never "flew"... Everybody's got opinions... Here's mine:

Amateur tcpip never "flew" because of the hostile, anti-ham attitudes and actions consistently displayed by amateur tcpip buffs, over the years. The constant foundationless vapor-hype, coupled with the almost total lack of accomplishment from the amateur tcpip community went over about like feces in the punch bowl. The constant insults and accusations directed against the general Ham community didn't go over too well, either.

That's why the great majority of Hams wouldn't touch amateur tcpip with a ten-foot pole. It might (or might not) be great, but that doesn't really matter after the way amateur tcpip buffs have alienated the general Ham population over the years. Nobody wants to be associated with them, no matter what they may or may not have to offer.

They pissed in the well, and nobody was impressed.

I'm looking for the frequencies around the atlanta area that aren't in the 56K range.

Thanks in advance.

There are many reasons why not. We have recently been discussing them
here - which YOU were obviously not aware of.

> > 1) The 2w ERP limit is huge advantage when attempting to construct
an

You might
> be surprised to find out how many modified VHF amateur radios are
being used on
> the VHF and UHF business bands - without power limits.

People get scared off by licenses. They want ready-to-go, turn-key
applications.

> > 2) Like it or not, people WANT commercial content. I don't see what

radio.

Like I said - people don't want to deal with licenses. The also don't
want to pay a lot of money. FRS radios cost as little as $20 at Wal-
Mart - if MURS radios can come anywhere near this number, it WILL be a
success.

> > Face the facts, Hank - the world has changed.

What an insight you have!

The PROBLEM is, at 1200bps they don't work very well.  Most all
applications have all been written to work at ethernet speeds.  NOBODY
wants to sit around and wait for things to happen.  The trick is to
come up with applications that are useful at 1200bps.  That's what I'm
working on.

Rob,

30 messages is an unrealistic expectation. If only 1% of the Amateurs sent

only one message a day, that would result in over 500 messages per day. And that's not really enough to support the infrastructure needed . The BBS message passing concept was doomed from day one, just because of how it was designed. It wasn't really designed bad, it just wasn't designed to support the numbers of users that it needed to support.

As to Junk Mail? One person's junk is another's treasure. Comparing to the Internet Spam, what most people don't realize is that Spam is profitable, if it wasn't, why would so many people be doing it?! It's part of any messaging system and you have to design for it and live with it.

Ed

I have read what you've been posting, many times. I don't remember hearing where you've created a solution to move messages across the country at more than 1200 bps. And no one else has either. The DSY modem is about the fastest in general use, that's only 56kb.

>
> > Maybe some protocols have been
> > tweaked to double the effective throughput, but we're talking orders of
> > magnitude that are needed for packet to be competitive.

> "... be competetive." With what? RTTY? PSK31? Morse?
> Explain what radio protocols and networking you are talking about.

Competitive = providing near the same or greater capabilities as others in a similar business. And since you have a corncob about people including the word RADIO in their response, I'll play to your game.
With all o fhte microwave frequencies that we have available to us, I don't know of a single network that is using these to transfer data at modern speeds. A DS0 at 64kb is trivial for a microwave shot. Something along the lines of a T1 or even a T3 are easily possible.

But the general user doesn't give a crap if the word radio is used in solving their problem or not. Walk up to a Red Cross shelter where you have Hank on his radio solution, and me on any variety of other solutions and which one will the public want to use?

We couldn't even think at moving this thread to packet radio. The delays would have made what has been a few days stretch into a few weeks. I've got 200ms delays from one coast to the other. Packet would have 200s at it's absolute best, more like 200m or even 2,000m.

> repeater with a connection to Internet and/or conference bridges all over the world. A sort of "free access" to the Internet, if you will. Well, I have drawn a line in the sand, with regard to Ham radio and Internet, and I think you need to as well. I am in agreement with Hank, W0RLI, and people who think as we do. I understand that the entire Pacific Northwest has taken a stand against forwarding via Internet, and I am with them!!! It is no contest when you compare the speed and volume of traffic that W6VIO (the BBS of Jet Propulsion Laboratories) can handle, when compared with the K6VE BBS, or other BBS's without an Internet connection. W6VIO wins "hands down!". But, W6VIO relies almost entirely upon Internet forwarding to accomplish it's goal to get traffic where it needs to go. What's the point? To kill ham radio?
>
> At the last SCAPS meeting (sorry you missed it, Jim), the SYSOPS took the first step towards assuring the fact that the HAM RADIO network can and will handle HAM RADIO messages. Files, simply copied from Internet or other sources, are no longer mandatory baggage in the #SOCA and #CENCA portions of WESTNET!!! In other words, if you want to learn how to make fudge brownies, check out the Internet, but if you want to send a message (or a bulletin that's authored by a ham about a topic that's relevant to hams), then check in to your local Westnet BBS!!! The SYSOPS do not consider their individual refusal to post and/or forward such bulletins as censorship, as they're available to any sysop who wants them, from the Internet! If you want to send out a 35 page manual, then you'd better be prepared to put it on disk and get it out via means other than Ham Radio!!! Of course, you can use ham radio to notify hams that the information you have is available, and some sysops might even want to post such data in their BBS files which may be available for LOCAL DOWNLOADS during "off-peak" hours. If, on the other hand, you want to send a message independent of commercial circuits, then HAM RADIO is your best choice. Hopefully, in the event of a disaster, HAM RADIO will be there to help. My sysop told me that sending a 38 page manual via ham radio is like carrying a pile of lumber in the family car! It's not meant for that purpose! THINK ABOUT THAT! Ham radio cannot compete with Internet, nor should it have to! Ham radio does it's best job in emergencies, when it's not required to send recipes and similar bulletins "ad nauseum". Ham radio doesn't have to compete with Internet; it just has to GET THROUGH, and not a lot of data at that! If most people want the ease and reliability of a 1200 baud connection to their local BBS, that's fine. What is most important is that they have a reliable and workable connection and that they have a RADIO STATION that's capable of operating from their home or place of employment, to assist others in case of a disaster. IT ISN'T IMPORTANT THAT THEY BE ABLE TO SEND 15,000+ RECIPES FOR DIABETIC POUND CAKE, just that they send the words "HELP...need medical supplies as follows...etc." It's absolutely crucial that we have as many HAMS as possible, and not that they have the fastest technology on the planet. It's better to have more hams with 300 or 1200 baud equipment than it is to have a few hams with 9600

```

Never mind Ed.

Just can't get over your "digital modes of ham radio must be JUST
like the internet or they are useless" fixation.

Just go away, this newsgroup is for hams who want to do things
over radio links. It is not for you, since you don't want to do that.

What *are* you guys talking about?

500 - 1000 messages per day was the norm, when the network
was working. Was a rare month I didn't handle 20,000 messages..

Posted those stats by year to this group some time ago.
The drop-off occured *after* the Land Line Lids began to bypass
the radio network, and continued to the present, as the radio network
was little by little taken off air.

Wrongo Big Time!
You might not have had access, but there was definitely a lot of Internet access available during and after the quake. You see, the Internet was originally designed as a fault tolerant network designed to live through the worse disasters. As such, there are many core Internet circuits that are extremely fault tolerant. It's very common for many locations to be served by multiple faul-tolerant circuits from multiple central offices. This doesn't include the satellite connections that many organizations have.

What about all of the Amateur facilities that went off-line? My review of the disaster showed a lot of repeaters going off the air, as well as VHF/UHF digipeaters. It seems as if very few of the Amateur Radio installations were earthquake hardened, unlike a large number of Internet facilities.

radio.

Yes, you are right, you don't have any customers because you aren't
providing a needed service.
Customers don't mean that they have to pay with money. Customers are the
users of your service. In Amateur Radio, we have many customers. Repeater
owners have the repeater users as customers. Clubs have members as
customers. Digitial networks have those who send and receive messages as
customers.
Those Amateurs who work Emergency Services have the world as their
customers.

He's right, Amateur Radio cannot compete with the Internet. So let's follow the situation. BBSs sprung up on the telephone network. Ham's copied the concept for packet radio. BBSs on telephones migrated to the Internet due to it's significant advantages. BBSs on packet radio mostly migrated to the Internet due to it's significant advantages.

Do you see a slight problem here Hank? You are asking us to believe in a concept that you are calling "landline lids" from which the whole BBS concept was stolen. The way that the BBS system was put together never worked well, it will never work well. If you want 1200 bps data to work, you are going to have to find another "killer app" aside from a BBS. Packet, passing messages around just can't compete with the Internet. But there are many things that packet can do that are competitive. One of the easiest modifications to the existing network is just what you are complaining about, replacing slow long-haul circuits with the Internet. And then using the faster VHF/UHF connections for dissemination of information to end users. In the event of a disaster, you should be able to provide routing via a VHF/UHF link until you get to a station that has connectivity to the Internet. That's the best of both worlds. It's not the Internet taking over. The Internet has some significant advantages, instead of fighting it, why not use it.
Although I hate to mention it, it's a lot like CW, a few die-hards wanting to use it, but no longer a significant factor.

First rule is disaster planning, never rely on anything. You should always have a fallback solution. There are just as many problems that can knock a wireless system out of operation as can knock a T1 out of operation.

You point about "you only have to reach the national network" is right on the money. After designing and implementing a transcontinental network for another service, it's not worth the effort. In every disaster that I can think of, all you need is to provide communications for about 200 miles before you reach reliable services. And in many cases, all you need is about 50 miles. So, far disaster recovery, we don't need to be looking at transcontinental links, we need to be looking a short-haul with interconnect into other networks.

If a packet station can provide RF links to stations in each of the 4 cardinal points, at distances of 50 miles, as well as an interconnect to higher-capacity networks, then the station should be significantly more disaster resistant. Redundancy is what creates reliability in disasters. You'd have to naive to rely solely on HF to transfer traffic, a good solar flare could bring forwarding to a halt.

Amateur Radio Operators used to be looked at as being the "innovators" Sadly this distinction has now passed us by. Let's let CW go and let's create something else that we can rally around!

Hank,

Folks who know me know that about as far from the truth as their is. I've been doing networks for years, both professionally and personally. I created the design for the packet network used in CAP. I really don't care "how" things are done, I just want to solve problems. In CAP we had a fairly nice transcontinental network setup. We were moving a fair number of messages and getting the rank and files interested in the solution. But then the big guys stepped in. In short, they outlawed our equivalent of @ww messages. This dropped traffic on the network significantly. And with this drop, user's interest dropped also, there just wasn't enough information to warrant the expenditure to get on the air.

Hank, you were one of the instigators in this phase of Amateur Radio, and you efforts were widely appreciated. You led many Amateur Operators away from a CW or Voice only attitude to a Digital way of life. I find it sad that someone that I have looked up to over the years has an attitude such as yours. I was expecting a forward looking individual, not one set in his ways such as yours.

Your arguments were exactly the same ones that many used to defend the voice and CW traffic nets. "How can a CW net survive if packet gets the message there first?" It's really ironic to hear you using the same arguments. I'm a technology guy. Amateur Radio used to mean technology, sadly no longer does it. But I think that there are some areas in which we can regain that title. Connecting repeaters together with digital audio over any type of link is an exciting opportunity. It indeed would be much better if we had 64k+ radio links, but we don't, so we have to settle for the next best thing, the Internet.

People aren't here to make your life miserable. They aren't forwarding traffic across the Internet just to put you out of business. They do it to experiment and provide a better level of service. Who likes reading ARRL bulletins that are three days old?

What I'm upset is that you see the word Internet and you go jumping all over it. Let others do their thing. Where would packet be today if it wasn't allowed to do its thing? Remember how many people didn't want to set aside ANY spectrum for packet radio? Remember how much of a fight it was to get 145.01, and then the other frequencies allocated to packet radio?

And while I don't talk about packet with the authority that that RLI brings, I do have a little background to speak from. I've create some packet software that's still used today. I've got a half dozen VHF packet stations in cases for rapid deployment. I've spent a few years doing transcontinental forwarding.

Oh, and by the way, this group is rec.radio.amateur.digital.misc not rec.radio.amateur.digital.packet. This group is for folks who want to do OTHER things with radio. Packet Radio isn't the ONLY digital mode.

Hank, I wish that you could come out of your current attitude and put your

```
creative talents to work again.

I noticed the "yet".  I interpreted it as generic sarcasm, shame on me!
You can be subtle when you really want to :-)

Whoa there pardner. This group is rec.radio.amateur.digital.misc because, way back when the rec.radio.amateur.* hierarchy was reorganized. A family of rec.radio.amateur.digital.* newgroups were proposed - and only this one survived the vote. It really wasn't meant to end up this way.

I'd be a little cautious about newsgroup-charter-mongering :-)

Heh heh ... quite a lot of what (many/most) folks take for sarcasm is
either my Midwest dry humor, or something subtle just to see if anyone
is paying attention ... or at least an attempt at same ;-)

Some folks think I take this stuff seriously!

We would be more concerned if Mt. Hood blew, since it is a bit closer
than St. Helens and Adams. Adams about 75 miles (nice view of it
out the shack window), Hood about 55 (also nice view), St. Helens
about 65 (behind the ridge to our north).

Perhaps GPS at each of the nodes near volcanos (or faults) would
provide useful data to the folks who monitor such things. Don't know
of anyone doing this. Suspect USGS might even fund something.

At one time I had a receiver on VLF hooked to a chart recorder.
Monitored one or another of those "big signals" at 10.2 KHz, 13.7 KHz,
etc. Nice sunrise/sunset effect, but the main use was to get early
warning of incoming ionospheric shocks, which might trigger some
unusual auroral propagation. Was doing a lot of DXing on 2M at the time.
Might be useful to have some systems like this toss alerts into APRS,

or perhaps better into the DX Cluster network.

(To the Land Line Lids: yes, I *know* the internet is faster)

come on hank, I know you are capable of better reasoning than that
(this is meant as a complement).

at the end of the day, any channel beats no channel hands down. The message
that keeps getting lost is that amateur radio needs to do better and
it can do better. Yes, radio will never beat fiber but that doesn't
mean that we shouldn't try to give copper a run for its money.

the Internet, like it or not, sets the lower bar. Ham radio should be
able to do as good as $100 modem for not more than twice the price.
Hams should be able to cooperate and get the message to where it needs
to go by any route possible. If that means tunneling through the
Internet because there aren't enough hams on the ground, then so be
it.

life is too short for pissing contests.

Charles,

While your idea is indeed a step above basic forwarding, it has some implementation problems, especially on HF.

Just to make things clear, I believe that your use of the term multi-cast is a little different than the generic use of the term. It seems as if your use of technology is actually a broadcast. The difference is that a broadcast is to all stations, while multicast is actually multiple routing hubs directly sending information to individual stations. But semantics aside....

The biggest problem with your multicast solution, especially on HF is that it does not include error correction. It is very common to have to retransmit packets on HF multiple times due to static or fades. Without an adequate error correction method, the chances of all receiving stations receiving a packet is very low. Multiply this by the number of packets in a message, then the probability that messages are transferred are nil.
To implement error correction in your solution, a protocol by which each receiving station would ask for retries would be required. Even with an error correcting protocol, traffic would come to a halt if one of the receiving stations was marginal, asking for resends on most or all packets.
The nature of HF makes any multipoint solution a big problem. With the network path to all stations being very variable, the reliability is just not there. Think of it this way, what is the probability that three stations can receive a signal from a fourth, for three seconds without at least one of the receiving stations missing a bit? Sure you can add FEC, but that increases the transmission times and still doesn't help the overall problem.

There's also a problem on VHF/UHF, the classic hidden transmitter problem. While no where as significant as the hf static and fades, it still becomes a problem. When a broadcast station starts sending its messages, there is nothing that prevents other stations from transmitting. And since a broadcast packet would go out as a UI frame, there is no retransmission. And as in HF, there is no error correction to cause the packet to be retransmitted.

In either case you have to be careful about network congestion and multiple stations wanting to transmit at the once. This could be greatly reduced by scheduling different stations with transmit periods.

The broadcast/multicast solution that you have suggested works fairly well on networks where the communication paths between stations is very strong, like an Ethernet. But it has problems with networks with high BER.

No, I'm not shooting my mouth off.

The problem with the QRK reporting system is that it doesn't indicate *why* the signals are bad or excellent. So the operator isn't given any indication of what steps need to be taken to improve the link. Basically, it is just the 'R' of the RST system.

Adding the S and T information is an improvement over the QRK report because it gives the operator potentially valuable information on the quantity and quality of the signal. That's why RST was instituted. What we need to do is to refine the S and T reports to make them meaningful for PSK31 signals.

The first thing we need to do is divorce the notion of S meter readings from the 'S' report. Historically there is no parallel between them. The S report merely uses an arbitrary scale that goes from very weak (1) to very strong (9). There is no direct correlation with an S meter, which often did not even exist on receivers in the era in which RST was developed.

S meters on current amateur equipment generally do not follow the somewhat mythic 6 dB per S unit anyway. They are in practice very nonlinear from one S unit to another, and typically range from 2 dB to 5 dB per S unit over their range. So the use of S units for reports is very misleading. (This nonlinearity is intentional to a large extent, manufacturers have found that amateurs tend to prefer receivers with a "lively" S meter.)

For the purposes of PSK31 (and other sorts of signals too), the more interesting S value is the signal to noise ratio. That information is usually conveyed by color on the waterfall display, but it should be trivial for the software writers to give us a number for the selected signal in the same fashion as they now give us an IMD number.

The 'T' report is signal quality, and that's very important for PSK31. We already have a good measure of it. It is the IMD number reported by the software.

We shouldn't limit ourselves to single digits for each of 'R', 'S', and 'T'. That may have been adequate in CW days where "by ear" estimates were the rule, but our software can do better than that. I'd suggest that the 'R' number should report percent correct copy to the nearest 10 percent, IE 00 to 10. SNR should be in dB, a 2 digit range should be sufficient. T should be the IMD value, also a 2 digit value.

So a PSK31 RST might be 09 15 23 meaning 90% correct copy, a SNR of 15 dB, and an IMD of -23 dB (minus assumed in the reports). This gives the sending station real information. He can tell whether he needs to increase (or decrease) power, and whether he needs to work on the linearity of his system to improve signal purity. The software could offer a "hot key" to insert this information automatically where a signal report is required.

> Then we add some FEC ... and ARQ ... and ... there we are!

Right back where we started from :-) I though the idea of PSK31 was to provide a friendly keyboard mode that didn't have the latency of error correction and ARQ. Somehow we seem to want to change it so it's just like Pactor and Clover - but then it won't be a friendly keyboard mode any longer.

I do think Gary's reporting system makes sense.

This topic was done to death about 5-6 years ago. Several robust "request fill" protocols were proposed, none were tested. The regulatory issues are minor with multi-cast, serious with broadcast (in the US).

A bunch of us code writers might well add such protocols, were there any interest. 5-6 years ago there was no interest in actually *doing* something.

CLOVER supports the underlying concepts particularly well, PACTOR has support for them. They could be used with PSK31. They could be used, in fact, with just about any signaling protocol. In the long distant past (when I had a model 104 TTY on air) something similar to this was done for distribution of some CP/M code (Lynn, WB6UUT, I think?)

What is needed are hams interested in actually *doing* it, instead of *talking about it*. Anyone home out there?

Yup, this is what CLOVER does (reports SNR).

> The 'T' report is signal quality, and that's very important for PSK31. We

CLOVER reports phase dispersion as well.

CLOVER reports information about sub-block reception.

Then we add some FEC ... and ARQ ... and ... there we are!
I think this is actually a *really* good idea.

With the protocol in open source, folks can play with it and improve it.

Of course this would be a lot different than PSK31 ("Just like RTTY, except
it sounds a little different.")

Wouldn't be the same protocol.

What I was hinting at was that it might be fun to experiment
with various different protocols of intermediate "flavor" between
PSK31 / RTTY and PACTOR / CLOVER.

CLOVER has some of that idea with it's FEC mode.
One could use that mode much like one uses PSK31, and get
a bit of error correction as well.

>> Charles,
>>
>> While your idea is indeed a step above basic forwarding, it has some implementation problems, especially on HF.
>>
>> Just to make things clear, I believe that your use of the term multi-cast is a little different than the generic use of the term. It seems as if your use of technology is actually a broadcast. The difference is that a broadcast is to all stations, while multicast is actually multiple routing hubs directly sending information to individual stations. But semantics aside....
>>
>> The biggest problem with your multicast solution, especially on HF is that it does not include error correction. It is very common to have to retransmit packets on HF multiple times due to static or fades. Without an adequate error correction method, the chances of all receiving stations receiving a packet is very low. Multiply this by the number of packets in a message, then the probability that messages are transferred are nil.
>
>This topic was done to death about 5-6 years ago. Several robust "request fill" protocols were proposed, none were tested.

Wrong. The protocols were designed, implemented and tested and have been in use for over a decade now. On packet satellites.
The hidden transmitter problem is worse there, transmitters don't hear eachother at all. Errors may be fewer than on HF, but poor stations that miss many packets are present just as well. The re-transmissions just help the others on the channel. When you know you have a good station, you just wait sending the last few hole-fills until other stations seem to have lost interest in a message and retransmits are not coming by themselves.
The transmitter station also queues and merges hole-fill requests so that multiple fills do not result in quick retransmissions of the same packet.

So what you need is a lower rate than that. Not because the network would not be able to transport it, but because the readers would not be able to digest it.

A better message category structuring system might have helped (putting everything in a single list with 6-character destination names sucked from the day it was invented), but Usenet shows that some people just won't get the intended purpose of the structure, and crosspost or multipost.

The mailbox software developed and used in Germany uses a groups system, and indeed both multiposting and posting of links to articles in other groups is commonplace there, causing more grief for the other countries where this "Diebox" software and its successors isn't in use.

>As to Junk Mail? One person's junk is another's treasure. Comparing to the
>Internet Spam, what most people don't realize is that Spam is profitable, if
>it wasn't, why would so many people be doing it?! It's part of any messaging
>system and you have to design for it and live with it.

For a simple bulletin system like the packet BBS to function, there should be a mentality that makes everyone ask "is this really worthwile to send on the bbs system" before sending a bulletin, especially to a wide distribution area. It was like that in the first decade of Usenet. The software printed a screen of text at every post, stating that the message one was going to type was to be sent all over the world to thousands of computer systems and that this was going to cost effort and money.

When everyone with a transceiver for sale or a cry for help would first think about the implications of sending this @WW and about the usefullness of a response from the other side of the world, the amount of junk would decrease.
But there are always people posting without thinking first, so any message network remains filled with mostly crap.

I found that a day's worth of packet bulletins took about an hour to "multicast". This left 23 hours to kill... So they were re-sent at different times of the day. That's 23 retransmissions of each bulletin per day.

It's been a while since I did that test run, but if I remember correctly, the transmitter would be keyed-up for several minutes (7-8 I think, but may be wrong) then it would stop transmitting for one second, then back to the grindstone again for 7 more minutes. Compare this to a normal 1.2 kb packet transmission with a PACLEN of 80 or 128, then you start to get an idea of how much "overhead" is eliminated. This is why it sends bulletins that might have taken you several hours to recieve in about an hour.

There's no "problem" sending updates... As a matter of fact, that's what you spend the great majority of your time doing!

Transmit on several bands at once, and recipients should be able to find a clear signal at just about any time of day.

When I decided to do that test run, I talked to the guys at the ARRL and FCC. Everybody told me to go right ahead; Nobody told me that there were any legal issues to worry about. I had made it clear that I would be sending @WW bulletins only. I heard nothing but encouragement.

W1AW broadcasts information "of interest to Hams" every day.

Who is intertested in developing HF multicast? I am!

I'm also interested in VHF/UHF multicast, for that matter. It looks like it might be fun.

You want to get in touch with the "regional coordinator" for your area. Where are you located?

However, it seems to me that you may be putting the cart before the horse a little bit. What I recommend is that you get your station "on the air", and get in contact with hams that are active on packet on the band you want to use. They will be able to help you more than us here.

I'm curious, what band do you plan on using, and for what applications will you use TCP/IP?

The problem with TCP/IP is that it has basically died on Amateur Packet radio. The fact that there are restrictions on commercial content(the level of restrictions is debatable), puts a big damper on trying to hook into the Internet from portable devices - probably the most desirable aspect of running TCP/IP thru radios. There is a new service called MURS(Multi-Use Radio Service) that has just been approved by the FCC. It does not require a license to operate, digital transmissions

ARE allowed, and they are not restricted to non-commercial
applications. If you haven't bought a radio yet - I would consider
looking into this.

Yeah, this is an interesting idea. The name 'multicast' is a little confusing
compared to the use of the word in ip. In those terms it's more
like 'broadcast.'

If you're just sending, maybe you could use PSK31. Just make a program that makes a file with the last day's @WW messages, put a CRC check on each one, and then update it every hour. On the transmitter just send it over and over again on PSK31. On the receive end, you download the stream. Check the CRC's and the one that pass you send over to mail.in on FBB.

Yes, I'm aware of those protocols.
I understood the topic to be HF protocols, my mistake.

This is true in some areas, not in others.
In some areas tcp/ip is alive and well..
If you are already on packet, you might check with wb1dsw or ka1rci.
```

They should be able to point you to the local coordinator, and
provide a good deal of information on how the network is structured.

Suddenly we have "using the tcp/ip protocol" mutated into
"connecting to the internet" and this is a problem because of
"commercial content". Huh?

Oh, I see, you are trying to divert hams from Ham Radio over
to some non-ham commercial service. What a Lid!

>
> It's been a while since I did that test run, but if I remember correctly, the transmitter would be keyed-up for several minutes (7-8 I think, but may be wrong) then it would stop transmitting for one second, then back to the grindstone again for 7 more minutes. Compare this to a normal 1.2 kb packet transmission with a PACLEN of 80 or 128, then you start to get an idea of how much "overhead" is eliminated. This is why it sends bulletins that might have taken you several hours to recieve in about an hour.
>

As I recall from the earlier discussions, there didn't seem to be much interest. If a few stations would sign up for testing and deployment, it might be fun to do the protocol over CLOVER FEC. That protocol would seem to be a natural.

> I'm also interested in VHF/UHF multicast, for that matter. It looks like it might be fun.

Where is the spec for the multicast protocol used on the pacsats? Looked at it a long time ago, and remember that nobody seemed interested in adapting it to other uses.

I never see any traffic actually arrive via the pacsat links, except for an occasional personal message. Do they handle bulletins anymore?

Oh, I wouldn't say that. I got started in IP on 145.01 back in 1989 with a program called NET. We had it running into some KPC-4 dual TNC for UHF/VHF operation. It was kind of neat to send the packet on UHF and get the ACK on VHF...

Then NOS came out and it was pretty neat. When I and a buddy bought a Gracilis packeTwin system and a Tekk radio, we had a 16 mile link with some beams on them. We first started out with the NetRom stuff, and then started playing with the UDP packets and segmentation. We found that setting in a 1500 byte packet and sending out 512 byte packets really moved the data. Basically the IP overhead was in the first 512 bytes, and the rest were pure data. This setup was actually faster than our 19.2k modems we used to do UUCP from Unix boxes (AT&T 3B2 -- Yee-Haw! a wonderful box) via the Telco.

Most of the people around here were never that interested in the NOS operation after a few days. These guys all needed a GUI or colored text to get them through the day :-)

I did come up with a pretty neat application. The National Weather Service had a NOS system and you could FTP weather data from all the remote sensors all over the state. I just scooped this every hour and then sucked it into Excel every month to make some graphical charts. Pretty neat to analyze your illness against barometric pressure, or lawn height versus rain :-)

Take a look at: ftp://ftp.ucsd.edu/hamradio/misc/auto-ftp.zip
For some old history :-)

I think you just hit on the REAL reason Amateur packet TCP/IP has gone dormant - the lack of applications.

If it wasn't for APRS, all Amateur packet radio would be as kaput as FidoNet.

There now ARE applications for packet radio AND TCP/IP. You watch, we are poised for a ressurgance of activity - all it will take is coming out with inexpensive modems(TNCs are history), and a little bit of software. I'm working on the solutions right now. Packet didn't die - it just went into hibernation.

Not exactly. It is just that MURS is better suited than the ARS for rebuilding the packet radio network - for two big reasons:

1) The 2w ERP limit is huge advantage when attempting to construct an Internet-backboned "cellular, frequency re-use" system: Blow-hards like yourself can't set up 500w ERP hilltop stations and "blow away" everyone in your county, AND all the surrounding counties to boot! Besides, with the Internet as a backbone, you don't NEED high-power, high-level nodes.

2) Like it or not, people WANT commercial content. I don't see what you are complaining about now; first you were bitching about hams using the Internet as a backbone, because of all that "commercial" content. Now the FCC has provided us with a solution, you are bitching about that.

Face the facts, Hank - the world has changed.

Hi Brian,

The latest version of PcPakRatt is 2.1 and that release is Y2K compatiable.
However it is only 16 bit. We have PkTerm '99 which is the only 32 bit
PK-232 software available that runs it in host mode.

You can download a demo copy, and play with the packet and RTTY modes at
http://www.cssincorp.com/pkterm

FTY, CSS owns both PakRatt and Pkterm.

you might take a look at some of the APRS programs.  They
decode packet cluster data and put an icon on a world map
to show the DX.

Uh, pardon me. You've found a new hammer and now everything is a nail?

MURS is not really anything new. It is recognizing that use of the itinerant
IB VHF channels was out of control.

MURS radios need to Part 90 type-accepted. Strictly speaking, this means
you can't just build or hack a radio for this service.

Further, MURS is six little skinny, regulated channels. It's no replacement for
oodles of thinly-regulated spectrum available to a radio amateur. MURS is a turn-key
consumer band with tight restrictions, and amateur radio is an experimentor's band
with little practical regulation.

Anyway, you're apparently not aware of the better Part 15 services, such as 900MHz
and 2.4GHz. In some cases, these allocations even overlap with amateur bands. I don't
see a flood of turnkey amateur operation there.

> 1) The 2w ERP limit is huge advantage when attempting to construct an

> Besides, with the Internet as a backbone, you don't NEED high-power,

> high-level nodes.

What does this have to do with MURS in particular? Nothing at all. You might
be surprised to find out how many modified VHF amateur radios are being used on
the VHF and UHF business bands - without power limits.

> 2) Like it or not, people WANT commercial content. I don't see what

> Now the FCC has provided us with a solution, you are bitching about
> that.

The FCC has long permitted commercial data, in the Part 90 service (for example).
Just fill out a license and buy type-accepted gear. It hasn't set the world on
fire. MURS will not, either. It is not a substitute for amateur radio.

> Face the facts, Hank - the world has changed.

Hank might have some zany ideas, all that Pacific Northwest moisture seems to have
gone to his head sometimes :-), but I believe he's right on about this topic.

Stewart, you're excited about MURS. Have you ever listened to those frequencies?
I don't think you'll be as excited after all the voice users start jamming your
data
network.

Just purchased a used PK232MBX, came with PCPakratt for Windows version 1.00A. Although it works, I'm sure there's got to be something newer and better. I'm not a packet geek and just need something simple to use. Use it 99% for Packet Cluster DX spotting. Any suggestions- I run a PC with WIN98. Thanks in advance. Brian K3USC

Typical LandLine Lid "thinking"... "Hey, let's use the Ham digital network
to send stuff you can get easier and faster on the Internet!"

How clever.

The "BBS crap" you disparage is the messages and bulletins that thousands of
HAMS care to exchange with each other. It doesn't come from the Internet; It
comes from your fellow Hams.

No wonder you (as a LandLine Lid) have so much trouble accepting it. ;-)

The spec is in the proceedings of the 9th CNC (1990), but there have been later mods and extensions that were distributed via the satellites as files. Hopefully they can now be found on the web somewhere. If not, ask Jeff Ward, K8KA.

There have been at least two implementations of a broadcasting station (I have experimented with one from Japan), and one broadcasting the content of an F6FBB BBS "on-the-ground". I don't know if these went beyond the stage of experiments.
The current German BBS program from the Baycom group should also support it.

>"... lack of applications ..." ???

>Ya gotta be kidding!
>Anything that runs over tcp/ip works!

Not in those days, Hank!
"NOS" was just the name of a certain version of "NET" that had a modified internal structure so that the interface between "applications" and "kernel" more resembled the BSD socket interface, but it was never separated into a kernel and applications at the distribution (executable) level. All the applications had to be compiled and linked with the kernel.

The result was a very large number of different "NOS" versions, each extended in some direction to include applications the particular maintainer liked, and with a stability reflecting the programming quality of that particular maintainer. You know, being sloppy with memory allocation or pointer handling just made the program leak memory or crash for other reasons, killing your entire station.

It took until 1992 for freely available Unix-like systems to come on the market (I installed my first Linux system in december 1992), and THAT was something that would have been nice to have in the early NET/NOS days. (the first NET version was released in 1985)

Now you could independently develop and run applications in separate processes, and have them crash independently. Plus existing applications could be used with packet radio without having to adapt them into the NOS environment. This was a big win, but it was too late.
Most die-hard NOS users would not part with their system, learn Unix/Linux, buy a better (at least 386) system to run it on, etc.
(I am not counting the happy few that had an old 3B2 from work, to have a decent user population one needs to use hardware that anyone can get)

Of course it became worse when Windows 95 finally appeared and all the hams went using that OS, for which usable interfaces between IP and packet radio did not appear for several years. The only "solution" was a separate box connected to a shack ethernet and running some router software (NOS, for example). This was just a too complicated solution when one could also run a packet terminal program interfacing with a TNC directly connected to the Windows box. The BBS user did not see any advantage of a network protocol anyway, as his connection is point-to-point over a local link.

The really attractive applications only got widespread with the introduction of Internet in the general consumer market (around 1997, 1998) and by then the amateur packet network was already losing its most active proponents.

So, it is not fair to say there was never a lack of applications and than

anything that runs over TCP/IP works. It does now, but it did'nt back
then!

Actually the pacsat broadcast protocols are not very tightly coupled to
AX.25 as a transmission protocol. Any protocol that can transmit delimited
datagrams could be used as a layer below them.

You really don't get it. Try rubbing a few grey cells together.

> Any
> traffic siphoned off by this alleged "bypassing" only leaves more

To use for what?
The traffic has already reached it's destination OVER THE INTERNET.

I *don't* get to use it. That's the point.

The above statement is why I asked you to think about it.

The level of ignorance shown here is one of the several reasons we
no longer have an RF based store and forward network.

> Do you understand the above paragraph?

Yes, I understand the paragraph. I also know that I designed and implemented a CONUS network for another service using packet radio. I've done quite a bit of long haul relay myself. I also know that long haul relay using VHF/UHF is for the birds. It can take days to send something across the continent. And on HF it's not much better. A single channel can only pass a few messages per hour, and unless you are using something like ALE, you have a very small window in which to transmit anyway.

But, as I and others have said, there is nothing stopping you from doing what you want to do, except that there might not be any users that want to use your services. And in that case you are just going to have to learn to live with it. You, know, there really isn't much call for commercial telegraph operators any more. Sometimes technology just passes people aside.

Also, you might want to look at refocusing your services to something that your capabilities better fit. Amateur Packet protocols aren't going to compete with speed of bulk transfer, so just live with it. But maybe they can compete during disasters or into areas not well served by high-speed connectivity. Smaller islands, remote wildernesses, and boats at sea still have need for connectivity that you might be able to assist with.

Sometimes you just have to learn to change when the environment changes. Amateur Packet Radio is a pretty old concept at this point, at least 15 years if I remember correctly. That's a long time for a data service to be in existence.

Absolutely right! So when someone comes up using for something that they
want, don't criticise them for it.

>

It's also slower for short-haul. I'm connected at 1MB+ speeds, that's about
20 times faster than just about any protocol in use in the Amateur spectrum.

>
> > But isn't it obvious that 1200 baud signals are significantly slower
than

Yes, you did. Amateur vs Internet. 1200 vs 56kb. People aren't using the
Internet just to thumb their noses at Amateur Radio. People are using the
Internet because it provides the capabilities desired. 56kb is considered
about the slowest link that you would want to use on the Internet, it's the
fastest link in Amateur Radio!

Don't forget that this thread is about linking VOICE repeaters together. It
wasn't about Packet Radio at all!

> Yes, I understand the paragraph.

... Then you understand the mechanism by which the use of non-Ham links to forward Amateur Packet Radio messages causes legitimate, Amateur Radio digital messaging links to die away from lack of legitimate traffic? Right?

Running the non-Ham link intrudes on the enjoyment of the hobby by your fellow Hams who ARE at least trying to use and so provide the opportunity to advance the use of Radio.

Thousands of US Hams lost interest in Packet, largely due to the introduction of "Internet Forwarding" of Amateur Packet Radio traffic. The @WW stuff multiplied expotentially. Before Internet Forwarding, BBS SYSOPs discussed the "heavy load" of @USA messages, not dreaming of the artificially produced flood of @WW junk messages the "Internet Forwarders" would soon pour into the network.

By engaging in this thoughtless, pointless activity, you, as a Ham, are then a LID, a Ham who operates in a fashion by which his fellow Hams are inconvenienced or prevented in their own enjoyment of the hobby.

You do it with non-Ham equipment, using commercial equipment and networks to undercut the work in that area (digital long haul distribution) done by Hams with Radio.

Your activities are stupid, rude, and pointless. You and your kind have set the US Packet network back, not brought it forward. Before "Internet Forwarding", the US provided leadership in the hobby. Since "Internet Forwarding", we have lost heart, dropped behind by over a decade while Hams in places that do not allow "Internet Forwarding" have pushed forward and developed both hardware and software far in advance of anything in the US. THEY got the high speed access, and REALLY high speed backbone links. Not US. - Thanks to you and those of your kind.

LandLine Lids

<chomp>

You clearly have no clue what I was talking about.
Please go back and re-read it, and then try thinking about it.

Before Internet Forwarding, BBS SYSOPs discussed the "heavy load" of @USA messages, not dreaming of the artificially produced flood of @WW junk messages the "Internet Forwarders" would soon pour into the network.

<snarf>

The one thing I disagree with. No problem at all handling all that data over HF and over long haul VHF/UHF links. I'm doing it now, to the *one* remaining place in the USA that is not bypassed by the internet. Doing it on HF as a matter of fact, at this very instant, on 15M, with a sustained data rate of 360 bps. Conditions are poor, the link usually runs at 750 bps.

Of course all this data *already arrived* at the BBS *adjacent* to the
one I forward with, over the internet, because the internet can beat
the several minute delay involved in the HF protocols.

The "anti-radio" folks appear to be pretty much clueless about all these
issues Charles. Gaining the knowledge of what actually has been done
in the past, and what has been done in other parts of the world, and
what could be done here ... is too much work for them. They take the
lazy non-ham way out, and pretend to be "involved with the hobby."

Are you only talking about the Mocom-70 here, or basically ALL
unmodified general-purpose commercial voice radios?

The HAPN-T 4800 baud Modem - doesn't that stand for Hamilton Area
Packet Network? What kind of modulation does/did it use? I found some
dutch site about Manchester modems, which showed a scope trace of a
typical HAPN-coded signal - it looks a bit like Manchester encoding:

http://www.dutch.nl/bdj/manmodnl.htm

What's the theory here? That Manchester encoding has a better chance
to work with commercial voice-grade radios at 2400bps? Is that why the
YAM modem uses Manchester encoded FSK at 2400bps? I've been trying to
get information on how this work is proceding, and I'm trying to get a
copy of the YAM 2400bps driver for Linux. If this is working out, I
wouldn't mind adding Interleaved Reed-Solomon Error Correction to the
YAM 2400bps driver - I bet that would also help.

Or maybe you have some problems getting your point across?

A) This thread was originally about linking VOICE repeaters. You muddied it up talking about packet data.

B) You seem upset that no one wants the services that you want to provide. Long discussion aside, if the service that you want to provide isn't needed, then it isn't needed. As in the business world, if no one wants to buy your product, it's pretty hard to sell it.

C) There are still many places where the Internet doesn't reach. So there have to be some opportunities to provide transport of information. You might have to work to find them, or to create them, but they are there.

D) As someone who has played in the long and short haul packet game for years, I know just how little data that I actually moved (or could move for that matter). It wasn't much. A 4kb message would choke the system for days. At about 5 minutes per hop, sending it to 20 other stations would take hours.

Hank, you just might have to reconcile yourself to the fact that your favorite aspect of the hobby is no longer feasible. Like those who really enjoyed building spark-gap transmitters, other new-fangled solutions can make things obsolete. I also know that under the best of circumstances, Amateur Packet Radio could not even think about delivering the content of just this forum, albeit the dozens more that exist. There's also a slight question about content legality that comes into play.

In the long run, I think that it's going to be Hank against over a 100 million Internet users. Be reasonable, which one do you think will win?

Ed

Are we talking about 1200 bps used in amateur packet radio? I'm confused
by something, help me understand what it is. 1200bps amateur packet uses
Bell 202, which encodes 1 bit per baud, making it a 1200 baud AFSK
signal as far as I can tell. 2400bps could be done with a 1200 baud signal
that encodes 2 bits per baud. What does 600 baud have to do with either?
I've always thought a two-level code means that two discrete values are
encoded, which is represented by 1 bit, and a four-level code means that
four discrete values are encoded, which is represented by 2 bits. What am
I overlooking?

Several Minutes? Your 360 bps equates to use over 100 KB per hour or about 3MB per day, one way. I transfer that amount of data in about 15 seconds from my connection to the Internet. If I am up for 3 hours, I can transfer more than you can in THREE years of 24 hours per day continuous throughput. Now, if we move to reality, you probably can get your 360bps for only about 6 hours per day, maybe 8, that's less than 1MB per day.

We really are talking apples and oranges here.

PLUS, you are trying to provide a service. Therefore you have users. Do you users want longer or slower delivery? Or do they want delivery "through Hank"?

Okay, so what if the circuits to the Internet fail and the current "faster than Hank" paths go out of service? Well, then you are there to provide a service. I just hope that people don't try to send more than 1MB per day! But on the other hand, after studying this subject in-depth, the probability of a disaster occurring that would cause long haul circuits in the US to be

needed is just about zero. Short haul is much higher, but long haul is
extremely small. I don't think that we have ever had the situation where
large parts of the country couldn't talk to each other.

Oh, and before you start with California earthquake things, don't forget
that the Internet has proven itself during every disaster that we have had
in the US, and most other countries. I've done disaster relief for
hurricanes where I've had Internet access at facilities that the eye of the
hurricane passed over.

The HAPN 4800 baud modem can operate with both FM and PM transceivers,
and has no requirement for near-DC response of the modulation.

Therefore it works with any transceiver that allows connections to the
modulator and discriminator, whereas the 9600 baud FSK modems need
response near DC and thus are unusable on PM transmitters, and transmitters
that modulate a VCO inside a PLL.

>The HAPN-T 4800 baud Modem - doesn't that stand for Hamilton Area
```

>Packet Network? What kind of modulation does/did it use? I found some

>http://www.dutch.nl/bdj/manmodnl.htm

>What's the theory here? That Manchester encoding has a better chance

It uses a 3-valued FSK system. I forgot the name by which it is known in the telecom world. The transmitter is on the center frequency between bits, and makes a short excursion to one direction for a 0->1 bit change, and in the other direction for a 1->0 bit change. Thus there is no DC content (the number of 0->1 and 1->0 transitions is always the same, no matter what the data is).

The HAPN design uses no scrambler, it just sends the usual NRZI data.
No manchester coding is involved, but indeed there are similarities.
A design with a scrambler was also made by a Belgian ham, but it is much less widespread.

HAPN indeed stands for Hamilton Area Packet Network, the designers of this modem. It was published in the august 1988 edition of Ham Radio, and many different implementations (with different digital interfaces and additional circuitry like 1200/4800 switching) appeared in the Netherlands, where it has been the defacto standard faster-than-1200 modem for a decade. Now that homebrewing is dead and off-the-shelf availability takes precedence over bit-error-rate considerations, the G3RUH-derived modems, usually used with unsuitable transceivers, have taken over.

There you go again: "... to the internet".
What do you manage using ham radio?

hello all,
i am a newbie, so please excuse.
i just bought a radio shack 10m rig (htx-10).
is there a way to hook the mike up to my pc
to work psk31 ?
if so, what are the popular freqs for 10m psk31 (if any).
no other hf in the shack, yet.
please reply directly to me, as i don't read newsgroups very often.
thanks,
73 de

Using the link for solely transferring of (near realtime) very short messages at irregular intervals will provide a useful service e.g. for DX-cluster and APRS messages. Such data usually becomes obsolete in a few minutes, but with lightly loaded links, the data will get through in a few seconds.

Such constantly on-line message transfers are a very useful for such end users that only have long distance dial-up or cellular phone data connections to the telecommunication infrastructure and thus can not keep the connection constantly on line, in which case the radio solution would be preferable (competitive).

However, trying to run bulletin store and forwarding over such radio links will very easily destroy the only advantage such links have, i.e. the moderately low latency times of the long haul links, thus making the link more or less useless for DX-cluster and APRS type near realtime applications.

Some low volume private mail transfer could be transferred e.g. by padding some very short real time messages with mail bytes since most of the air time would be taken by Rx/Tx turnaround delays anyway.

Apart from very specific applications, bulletin store and forwarding is a dead horse, no need to beat it anymore.

Your participation would be most welcome.
```

We have PACTOR, PACTOR-II and CLOVER systems on air in the Portland/Vancouver area. There are several PACTOR-II systems north of us (Washington and British Columbia). Three CLOVER systems in California. Always looking for more links.

Westnet is still alive and well ... at least for long haul links.

WESTERN CONNECTICUT HAMFEST
Sponsored by: Candlewood Amateur Radio Association - CARA
http://www.danbury.org/cara/

Sunday, September 17, 2000
Edmond Town Hall, Route 25, Newtown, CT Exit 10 off of I-84

Admission $4.00, Kids Under 12 Free.
Table Set-up at 7:00 AM.
Tables $10.00 Tailgating $6.00. (Both include 1 admission).

Commercial vendors include West Mountain Radio (the RigBlaster folks), KJI Electronics Inc. and Signs by Ron.

ARRL Sanctioned. Talk-in on 146.67 (-) PL 100.0. Handicapped Access.
Ham Radio Equipment. Computers. Door Prizes. Refreshments.
Ample Parking. Rain or shine.

Only 12 minutes from Brewster, 15 minutes from Waterbury.

For information call: (203) 798 2831 (914) 831 3124 or (203) 743 9181

And I've delivered 35,000 message in 4 hours across the Internet. And that's message about 10k long. To destinations around the world. And the server or circuits weren't working hard.

And that is the issue!

The Amateur Packet System showed most folks, years ago, that it was not capable of handling the amount of traffic that was needed of it. And nothing has been done to make the situation better. Maybe some protocols have been tweaked to double the effective throughput, but we're talking orders of magnitude that are needed for packet to be competitive.

Oh, and in Loma Prieta, the Internet was still active and handle significantly larger number of messages than 6,000.

Oh, and in your 1357 message, was the total data transferred? I'll guess most messages to be less than 500 bytes and with a few R: headers, average size would be about 1k. If you were to look at the numbers that I presented, a 4k message to 20 stations, that would represent a total transfer of 80k. If my guess of your 1k message size is close to correct, that then indicates that you transferred 1357k. At your fastest rate, that would then indicate that 80k would take about 1.4 hours to be sent. While maybe "hours" wouldn't be a good description, it's not that far off.

Hank, if Internet forwarding is so bad, then how come your customers aren't yelling and why are the other forwarding stations doing it?

Ed

Chris,

There's definitely a lot that you can do. I would suggest that as Hank suggested, that you do visit the TAPR site and their forums, as well as any of the APRS information sources on the Internet. You might also look for some folks in your local area to work with.

Ed

Do you have any idea how silly that sounds?

Perhaps you could compare ham radio to the US Post Office,
or FedEx, or UPS, or a Volkswagen full of DAT tapes.

And then whine about how we should abandon ham radio because
it cannot deliver as much data across town as a VW full of DAT tapes.

Presuming that you mean "publish", and not "broadcast", you can use any number of different applications to provide an RF<->Internet gateway. Under Linux, for example, you can use the aprsd package (available at www.wa4dsy.radio.org) to do just that.

There is an extensive system of APRS internet servers already in place. For example, you can go to my site, http://mulvey.dyndns.com/aprs to see one in action, with a Java applet (written by Steve Dimse) to allow viewing of Western NY data & maps. You can also get just the data feed by telneting to port 14579.

As for publishing everything from the net to RF - only if you intend to piss off a lot of people in a very short time. Try telneting to first.aprs.net, port 1313, to find out why - there is a HUGE amount of APRS data being passed around on the net, and a 1200bps channel would fold up and die with a full feed.

>I am starting from scratch, and have no information on this subject.
>Any help, direction, web sites,lieteture, guidance, etc...would be

Join the various APRS lists at www.tapr.org. They're a good jumping off point.

"... be competetive." With what? RTTY? PSK31? Morse?
Explain what radio protocols and networking you are talking about.

> Oh, and in Loma Prieta, the Internet was still active and handle
> significantly larger number of messages than 6,000.

My wife was at work at Seagate Technology in Scotts Valley when the
quake occured. There was no dialtone in Scotts Valley. When she reached
our house about 2 miles away, there was dialtone and she called me.
The line dropped a few minutes later, and stayed out for 3 days.
The internet handled zero messages during that time.

In the Marina there were no functional telephones for several days after
the quake. There were two mobile packet systems however, set up in
vans that went from shelter to shelter handling health and welfare. That
traffic went out on HF via N6VV.

> Oh, and in your 1357 message, was the total data transferred? I'll guess most messages to be less than 500 bytes and with a few R: headers, average size would be about 1k. If you were to look at the numbers that I presented, a 4k message to 20 stations, that would represent a total transfer of 80k.

You guessed wrong. Try again. You are not even close.

> If my guess of your 1k message size is close to correct, that then indicates that you transferred 1357k. At your fastest rate, that would then indicate that 80k would take about 1.4 hours to be sent. While maybe "hours" wouldn't be a good description, it's not that far off.

Your guess is wrong. Try again. You are not even close.

As with most of the Land Line Lids, you don't seem to have a clue how much traffic can be, and has been, moved over HF links and long haul VHF/UHF links. Your "guesses" are simply silly propaganda.

If you want the real numbers, you can retrieve the log files collected by the ARRL and analyze them yourself.

> Hank, if Internet forwarding is so bad, then how come your customers aren't yelling and why are the other forwarding stations doing it?

I don't have "customers". It is the internet that is a business, not ham radio.

The following quoted verbatim:

To the S.C.D.C.C. and other interested parties......
...an open letter to Jim, N6HNY, who runs the SCDCC re-mailer
on Internet

I want to advise you about the danger of following the advice of certain "techno-nerds" who are promoting the idea that ham radio must become an extension of Internet and provide access to that medium. Beware of where they're leading you! Their ideas are flawed, and tend to undermine the concept of what ham radio is all about. I'm talking specifically, about one or two people who are trying to convince the SCDCC and a repeater owner to establish a 9600 baud duplex packet repeater. Having just that, is one thing, but their "hidden agenda" is to have a duplex repeater with a connection to Internet and/or conference bridges all over the world. A sort of "free access" to the Internet, if you will. Well, I have drawn a line in the sand, with regard to Ham radio and Internet, and I think you need to as well. I am in agreement with Hank, W0RLI, and people who think as we do. I understand that the entire Pacific Northwest has taken a stand against forwarding via Internet, and I am with them!!! It is no contest when you compare the speed and volume of traffic that W6VIO (the BBS of Jet Propulsion Laboratories) can handle, when compared with the K6VE BBS, or other BBS's without an Internet connection. W6VIO wins "hands down!". But, W6VIO relies almost entirely upon Internet forwarding to accomplish it's goal to get traffic where it needs to go. What's the point? To kill ham radio?

At the last SCAPS meeting (sorry you missed it, Jim), the SYSOPS took the first step towards assuring the fact that the HAM RADIO network can and will handle HAM RADIO messages. Files, simply copied from Internet or other sources, are no longer mandatory baggage in the #SOCA and #CENCA portions of WESTNET!!! In other words, if you want to learn how to make fudge brownies, check out the Internet, but if you want to send a message (or a bulletin that's authored by a ham about a topic that's relevant to hams), then check in to your local Westnet BBS!!! The SYSOPS do not consider their individual refusal to post and/or forward such bulletins as censorship, as they're available to any sysop who wants them, from the Internet! If you want to send out a 35 page manual, then you'd better be prepared to put it on disk and get it out via means other than Ham Radio!!! Of course, you can use ham radio to notify hams that the information you have is available, and some sysops might even want to post such data in their BBS files which may be available for LOCAL DOWNLOADS during "off-peak" hours. If, on the other hand, you want to send a message independent of commercial circuits, then HAM RADIO is your best choice. Hopefully, in the event of a disaster, HAM RADIO will be there to help. My sysop told me that sending a 38 page manual via ham radio is like carrying a pile of lumber in the family car! It's not meant for that purpose! THINK ABOUT THAT! Ham radio cannot compete with Internet, nor should it have to! Ham radio does it's best job in emergencies, when it's not required to send recipes and similar bulletins "ad nauseum". Ham radio doesn't have to compete with Internet; it just has to GET THROUGH, and not a lot of data at that! If most people want the ease and reliability of a 1200 baud connection to their local BBS, that's fine. What is most important is that they have a reliable and workable connection and that they have a RADIO STATION that's capable of operating from their home or place of employment, to assist others in case of a disaster. IT ISN'T IMPORTANT THAT THEY BE ABLE TO SEND 15,000+ RECIPES FOR DIABETIC POUND CAKE, just that they send the words "HELP...need medical supplies as follows...etc." It's absolutely crucial that we have as many HAMS as possible, and not that they have the fastest technology on the planet. It's better to have more hams with 300 or 1200 baud equipment than it is to have a few hams with 9600 baud communications tied to a single repeater with a port to the internet! Talk about putting all your eggs in one basket! That just doesn't make sense! The ham radio network that we have in place right now, works very well for what it needs to do now, and in the event of an emergency. That's what is important. If you want to do something good for ham radio, get the word out to everyone that YOU CAN BE A VALUABLE PART OF AN EMERGENCY COMMUNICATIONS NETWORK, and not the current pitch of offering free access to the Internet or worldwide conference bridges at 9600 baud or greater speeds via a "free" ham radio duplex repeater.

What messages?

Out of band mods, and scrotum scratchings from Brazil and West Africa?

Ham radio is a real-time communications medium. The stored message with email like features has been a complete failure.

Get over it.

> So lets stop the forwarding of packet messages by internet.

> My wife was at work at Seagate Technology in Scotts Valley when the
> quake occured. There was no dialtone in Scotts Valley.

The recent fire in Los Alamos was a similar example. The Information Systems manager for the county needed to link all the fire departments together, and sent out a request for proposals on a new system. He found that a wireless system was actually cheaper than the T-1 based system proposed by another proposal.

Turns out during the fire, that the phone system was dead (shut down to prevent damage during the fire). If he had relied on a T-1 based solution, he would have had zero communications.

What this shows, is that a lot of technology has matured since the quake you mention.

The object isn't one of handling 6000 messages, it is one of on-line communications, both voice and data. The wireless networks available today only have to reach the next point into the national network.

FEMA often provides this service now, by rolling in a Satcomm truck and hooking in to whatever infrastructure you have left. They also provide a telephone tent which is used as a command center or citizen access to call outside the disaster area, via the Satcomm link. They have access to NCIC and all the channels you need to run a city, just like before the disaster.

If you really want to have an impact, develop a wireless solution in your community. Hams know how to do this, as it involves antennas, coax, lightning protection, solar power, and radio towers. With new rules in hand, Hams can now do high power spread spectrum, that can blow away anything done under Part-15 of the CFR.

Forget about a low-baud HF link to a point 2000 miles away, and concentrate on developing a megabit link to the next town, or up to a peak with a solar powered relay site to the next town, etc.

Steve

That's absolutely correct and I'm very glad someone brought it up. If you make a tcpip connection in WinAPRS just for your own observation purposes, you'll find in just a few minutes that you have accumulated 3,000 stations from around world. Not only would it flood the RF side of things to the point of it not being able to keep up with the internet traffic alone, but none of the stations on the RF side will ever get a chance to be heard. You'll also find that the majority of folks on the RF side don't care to see someone motoring around in Atlanta or LA, or to see two guys in Texas sending one-liners to each other, if they're in a completely different part of the country. I-gate stations need to be coordinated within the RF network area that you are located, and it is very important that proper parameters are established to allow only that traffic intended for your geographical area to be passed onto the RF side. It's great to see Chris have the desire to participate and promote interest in APRS. Just be sure to check with the experienced locals or an area coordinator before getting an I-gate or wide-area digipeater going.

Bob, KB7ADO

news:ss0bj4qbct653@corp.supernews.com...

> What messages?

The messages and bulletrins Hams sent to each other via digital Amateur Radio, just as they still do today. (In parts of the world where "LandLine Lids" are outlawed.)

>
> Out of band mods, and scrotum scratchings from Brazil and West Africa?

Yes, all that and more! The message content is determined by the thousands of Hams who send those messages. It's not really any of your business, unless a specific message is addressed directly to you.

>
> Ham radio is a real-time communications medium. The stored message
> with email like features has been a complete failure.
>

Nope. It's working just fine - Where "LandLine Lids" such as yourself are legally restrained from vandalizing the system.

> Get over it.

Don't worry; We (Hams who use Radio) will "get over it"... With the US as a great example of the damage that "Amateur Telephone" does and with Europe as a great example of what can be accomplished when "Amateur Telephone" is outlawed, new, effective regulation of "Amateur Telephone" activity here in the states is pretty well inevitable. The issue is getting International attention, and not just on these news groups. The "movers and shakers" are starting to wake up and smell the coffee.

> >   So lets stop the forwarding of packet messages by internet.

> > a vast assemblage of data resources, not as a REPLACEMENT for
> > radio forwarding.

That's the right approach, and since the "LandLine Lid" types have made it apparent that nothing short of new regulation will stop them from disrupting the hobby, we are not left with much choice except to regulate their activities, ENFORCING the common decency and regard for their fellow Hams that they lack within themselves.

I've suggested a way to beat that speed for distribution of "across the country" several times, and even did a brief on the air test. I didn't get much feedback, and assumed a lack of interest... Are you interested? - Or just shooting your mouth off?

>Nonesense.

While the above numbers may be a bit exaggerated, it is certainly true that the original forwarding protocol used by W0RLI, WA7MBL and AA6RE systems had serious flaws in both the protocol and the implementation, causing behaviour like the above.

It also meant that sysops invented all kinds of limitations to avoid being hit by these problems, including "defining" size limits for local, region and world traffic, and flaming senders for going over these limits.

As the defined size limits were not widely known, and not the same in every region (they of course depended on the quality of the local infrastructure), it could easily happen that one sent a message from the Netherlands @EU, and then get flames back from UK sysops (those were the nastiest) about the unacceptability of "messages as large as 10KB".

Of course, with the advent of F6FBB's BBS and the more advanced forwarding protocol it introduced, these worries were mostly a thing of the past.

Gerard,
Perhaps you could explain the "QRK" report, I've never heard of it. I
find % copy seems to make sense.... it lets you know how well the
signal is received.

Nonsense? What's the most number of messages that you've moved in a single
day? I've done the math, I've demonstrated it in a live network.

Hank,

Packet Radio has been around for a very small portion of the life of Amateur
Radio. I find many other facets of the service to participate in.

Ed

Charles,

I'd have to disagree with your interpretation of history. My experiences show that Amateur Packet Radio died because of a lack of interest. The @USA messages had killed packet radio well before @ww ever appeared. Reading hundreds of "for sale" messages just wasn't that interesting.
Packet never really had it's "killer app", the app that makes everyone want to use it. Most folks that I knew got a TNC, tried it for a little bit and then put it on the shelf. There just wasn't a compelling reason to use it.

The closest that has come to the "killer app" for packet is APRS, but it's more of a niche application than a mainstream one.

What's sad is that Packet Radio represented an excellent opportunity for Amateur Radio to assist others, but very few people did anything to move it forward. As far as I know, there were probably less than a dozen applications that use Packet Radio, BBS, APRS, DXCluster represent the majority of use. But there were many others that could have been created, but so few Amateurs seem to be in "creating" things any more. I created an application that we've used at the Annual Peachtree Road Race for about 10 years, coordinating the medical tents and Lost & Found. There was one other that I knew of that assisted ARES operations, but that's about it.

But after 10 years of 1200 bps data transfer, I'm looking for a replacement so that we can provide our customers with a higher level of service. 2400 doesn't help, neither would 9600. 56k is the minimal solution that we are looking at. And the DSY modem isn't a solution because it's too bulky and expensive. the only solutions that are surfacing are the 802.11 wireless cards. 11 Mbps gives us some possibilities that don't exist at 1200 bps.

Ed

I have a very hi-profile packet station, running APRS. The computer that controls the TNC, has an active 100 base-T network connection. I can get a static IP if need be.

What I want to do, is "broadcast" all the RF (APRS) data to the internet...and gather all the internet (APRS) data, and "broadcast" it to the RF side.

I am starting from scratch, and have no information on this subject. Any help, direction, web sites,lieteture, guidance, etc...would be most appreciated.

Thanks much,

Chris

While I'll agree that RST is outdated, of all of it's indicators, T is probably the best fitted to PSK31. The "tone" relates to the spectral purity of the transmitted signal. and the purity of the signal is very important to the PSK31 signal. The T probably could even be directly connected to the IMD of the transmitted signal.

R, as readability is either 5 or 0 either you are decoding the signal or not.
S, the signal is still important, but in the digital world it has been replaced by the BER, Bit Error Rate.

I have sent several emailsl to Gary Johnson(KF7XP), the provider of XPWin (XPWare). I can't seem to get a reply(email: xpware@home.com). I got the email address from his webpage(http://www.goodnet.com/~gjohnson).

Does anyone know if Gary has a new email address? If so, please let me know.

Thanks much!

Chris,

While TCP/IP supports broadcasts, the Internet does not. There is a permutation called multi-cast that is close, but it also isn't widely supported. So, to do what you want, you will have to use transmissions to all systems that you want to send or receive data from . UDP would probably be the protocol that you would use.

Ed

Ok..thanks.

Is there anything else I can do with a TCP/IP connection?

I see APRS packets with "TCP/IP" in their paths...what does that mean
(do)?

Thanks again.

Ed, I suspect your mind is made up, and you will refuse to read anything that disagrees with your anti-radio position. I'm not posting this to try and convince you of anything. But there are others who might have the interest and capability of understanding the issues. I quote the following verbatim:

KF6QDP wrote to LLL on Sat Apr 11 22:48:53 1998:

> In summary, although I would like to see high-speed ham radio data networks, I do accept the fact that the internet is here to stay. We should try to integrate this new technology and not alienate its users.

Bruno --- "INTEGRATE" is the key word. Unfortunately, in MOST cases, the internet is not being integrated with the radio network, it is REPLACING the radio network.

It would be great if the internet were being used as a RESOURCE, rather than a VEHICLE. Here is a simple example:

Many sysops around the country have callbook servers running on their system. If you are lucky enough to be able to connect to one of them, you can directly query the database for names, addresses, etc. If you live a little further away, you can send a message to the server, and get your information back in the form of a return message.

Right now, those callbook databases are residing on the sysop's hard drive. At best, most of them are usually updated on a quarterly basis. If, instead of accessing a "quarterly update" on the hard drive, the callbook server would access one of the callsign databases on the internet, you could have access to a database updated on a daily basis! Wouldn't that be nice? It would certainly free up considerable space on sysop harddrives around the country, too!

The same thing could be done for radio mods, antenna designs, and a "zillion" other topics which currently reside on the hard drives of sysops all around the world. The internet would then be used as an information resource to provide ADDITIONAL services to the packet community, not as a vehicle to transport all the messages between amateurs.

Unfortunately, in most cases this is NOT what is being done. Instead of ADDING TO packet radio, many unimaginative and uncreative (and yes, probably "lazy" too) operators are using internet resources to REPLACE the radio part of the equation. The only "radio" part they are leaving is from the individual packet user to the local BBS. In many cases, they are even providing landline connections to the local BBS, so radio isn't even needed there!!!!!

Stop and think about this for a minute. What they are actually doing is becoming third-rate, imitation, internet service providers themselves! Yet, they can't measure up to even the free e-mail only providers like Juno.

The only thing these people offer to packet radio is a little more speed in forwarding messages over longer distances. But at what price do we achieve the speed? As more and more forwarding is done via the internet, there is no reason for radio networks to be built or maintained. After all, the internet is faster, easier and cheaper to use than a long-haul radio network.

As the radio network disappears, so does the prime justification for continuance of the amateur radio service. When you cut through all the window-dressing, the only reason governments around the world allow the continued existence of amateur radio is that we represent a "FREE" backup communication resource for them to use in times of disaster or war .... when "usual" lines of communication are out of operation. "Usual" these days tends to mean internet or other landline means. So, if we become dependent upon the internet to maintain our "packet network", how are we going to be able to offer an alternate means of communications when the telephone lines and the internet fail?

What the multitude of governmental agencies expect the amateur community to be able to provide these days is far more than can be handled by the National Traffic System alone. It requires the existence of a Digital network as well. Without a Digital RADIO network, we simply can't handle the job. When the government realizes we can't handle the job for them anymore, just watch how fast those frequency allocations go up for sale!!!!!!

So lets stop the forwarding of packet messages by internet. Let's maintain and increase our radio network for the TRANSPORT of messages. Let's INTEGRATE the technology by using the internet as a vast assemblage of data resources, not as a REPLACEMENT for radio forwarding.

73, Ken K7IQI

convince you of anything. But there are others who might have the interest
and capability of understanding the issues. I quote the following verbatim:

W1UU wrote to WB1DSW on Fri Nov 13 09:44:06 1998:

> Good morning, Herb.
> This is getting interesting! But I am more than pleased the discussion
> isn't nasty. I have been reading the DEBATE information from and to
several
> people, so I am getting a sense of what you are telling me.

Peter -
Again, I'm not buying any of it!
Let me be absolutely blunt clear and to the point - so that you can "get the
sense of what" I am telling you. Telephone forwarding is for the folks
who have abandoned amateur radio. If you want to be included in that
bunch, too bad.

>
> >Well I've had enough time now to digest what you said the other day.
Needless
> >to say, I'm sorry, but I don't find much to agree with.
>
> You stated a premise to me. I went into some detail about some of my
radio
> only solutions. I don't know if you disagree with some of my
radio
> experiments.

C'mon, Pete - this is a most gratuitious statement. You know exactly how I
feel about radio experiments. And even if telephone forwarding is an
"experiement" as you call it, you've done it, works good, point proven, time
to stop.

>
> > I look for the
> >"substance" - all along I've been talking about building not destroying the
> >amateur network.

This means that telephone forwarding does nothing to solve any of the
problems of support for networking. You decided to telephone forward and
now have decided, to the chagrin of many sysops in this community, to

force it down our throats by transmitting your "experiement" out to the
amateur network. You face unpopularity. I'm trying to get you to see
how telephone forwarding is ruining all we have worked for.

> I gace you several examples of radio network solutions. Things like
spread
> spectrum. I also told you how I have approached radio networking. I didn't
ask
> you to agree or disagree. I told you what I am doing, and things that
interest
> me as points of information.

Fine, as long as they involve ham radio. Telephone forwarding does not
"encapsulate" the traditions of ham radio.

>
> > BTW, I notice I got no answer on how N1KIO and WB0TAX
> >reach your system but I think I know.
>
> I receive traffic from N1KIO and WB0TAX via net/rom, as I told
you.
> Specifically, it is accomplished via an AXIP link. Briefly, these are
AX.25
> encapsulated packets within IP packets. These links are set up in a way that
a
> net/rom can also be set up to cover great distances. As you probably know,
a
> net/rom is good for up to seven (7) links before the connection can go
no
> further.

Aw, please! You're using the telephone, Pete. Why not just admit it?
What kind of fool do you take me for? We've been doing AXIP on the ham
bands for years. Big deal... I'm not impressed.

>
> Your radio link wasn't shut down. Through the W0RLI protocols (as well as
my
> F6FBB protocols), you probably found out that the message was already there.
> You probably got the N - Bid symbology.

Yes, that's it. You, by injecting your telephone forwarded traffic onto
our network, did, in fact, prevent me from receiving traffic and then
relaying the traffic into our local amateur radio network, BECAUSE you had
already done it via the telephone. Thanks loads for doing that - your
"experiementing" crippled my system. (By the way, it's a small point but BID
rejecting is not a W0RLI protocol - it's a global procedure agreed to by all
BBS/Mailbox software authors)

> I am not sure what you mean. I can only guess: Your desire is to have
radio
> take top priority over other forms, because of what you have said below.
> Why the heck did I spend all this time and effort only to have the

> >telephone forwarding nitwits ruin it all.
>
> No comment on your choice of words.

(Remember, please, at this point, you still had not admitted to me that you
had received traffic via a telephone forwarded stream. You veiled it as "I
use net/rom protocol AX.25 encapsulated in IP". I would have had to assume
that you were a telehpone forwarder. Thus I didn't call you a nitwit)

> But let me rewrite this sentence:
>
> Why the heck did I spend all this time and effort only to have
other
> technologies take over a pure radio system that does the job I want it to?

Wrong! "Other technologies" do not do the job "I" want them to. They
undermine what I (and many other hams) want to do.

> >The larger question which we all
> >should worry about is: Why should I now spend any further time and effort
> >only to have the telephone forwarding nitwits continue to ruin it all?
>
> But let me rewrite this sentence:
>
> Why should I now spend any further time and effort only to have
other
> technologies disrupt what I believe works much better?

Uhhh - this sentence has confused logic. Who is the "I" here? Are you
trying to say that I believe this? Do you believe this? Who believes it?
You've apparently re-written my sentence to fit your goals. I guess I'd
much prefer it if you'd leave my sentences be and write your own.

>
> >And
> >you wonder why users are leaving packet?
>
> Great question!
>
> >It's not amateur radio - it's the
> >internet network and there's no longer any need for experiementation, having
> >some fun building, trying out new protocols and all the other wonderful
> >stuff that the ham radio hobby provides.
>
> There are two thoughts in your answer. This is what I think you are saying:
>
> 1. Amateur radio solutions provide fun for building, trying out new
protocols
> and all the woderful stuff that ham radio provides.
>
> 2. The internet network does NOT provide fun for building, or trying out
new
> protocols and wonderful stuff.

No, wrong again. There's only one thought. Building and maintining a radio
network is what we're all about which isn't helped at all when someone
continues to route around it.

>> >No, we've got to have the speed, baby.
>
> That is a good reason, in my book. Everything going on in
"wireless
> communication", which includes amateur radio, could use high speed.
Actually,
> I don't quite agree with this. Faster throughput is a better definition.

Yup, the phone is faster. Not going to deny it. The fact that it is faster
also a poor reason for allowing telehpone forwarded traffic to steal away the
fun and enjoyment we all are seeking and have sought since we began linking
stations on the HAM BANDS many years back. Amateur networking will continue
to decline when put in direct competition with the phone. And, as I read you
you keep saying "wireless" at several points here. Could be I've missed the
fact that N1KIO and WB0TAX are linking to you by a satellite. True?

> >I'll submit a proposal for you to ponder. I hope you'll agree to try it.
> >Here goes: For one week, let's try not to inject telephone forwarded
> >mail and bulletins from N1KIO/WB0TAX into the RF network. In just seven days
> >we should be able to tell just how much we would really be missing if we
didn't
> >engage in the practice of telephone forwarding. I think you'll find that
> >the quantity is practically the same, the quality is probably higher (no
> >more binary squash at least)

"Binary squash" here meant that we have documented many many instances
where telephone forwarded messages have been horribly mangled. We talked
about N1KIO's problems a couple of weeks ago not to mention the months
old Keplerians he was tossing in for good measure. I see the term "squash"
has confused things.

> Most every BBS uses "binary squash" except the AA4RE BBS. You use
Xcompression
> in the W0RLI program except when talking to an AA4RE BBS.
>
> >of what gets passed around, and that the latency
> >of the RF network isn't going to be that much less. What I am trying to
> >show you is we don't need telephone forwarding - period - and so you should
> >stop passing it on to the amateur radio network. Receive it all you like
> >and please, keep it. Again, if my theory is true, why should anyone
continue
> >to support it?
> >
> >You game?
>
> No, for two reasons:
>

Hey, it's only for a week! C'mon - live dangerously!

> 1. I want to continue to examine the tcp/ip protocols, and whatever new

(See - there's that word again...)
>
> 2. I want to examine how wireless networks can benefit from internetworking.
>   Also, I want to write about it, and present findings for comment by
>   anyone.

Well, it's been a couple of months now. When's this paper due out?

>
> Herb, please understand that these are my desires. It is not my intent to
have
> you convert to my way of thinking about problem solving. If you truly
believe
> that an all pure radio network can exist, and there are people out there
that
> have expertise, desire, money, or anything else, then count me in! That is
why
> I have a radio system, and I listed those things I am trying to do.
>
> If you think I am creating a system that will bypass WB1DSW, the answer
is:
> NO.

That's precisely what I think. I asked you to try one week without doing
it and see what the impact is. (And I would ask that we do this after I get
the UGM link back up. I think that's totally fair...) I find your reasons
for not taking the pledge for one week vague and unconvincing. I'm thinking
what could he possibly be afraid of.

>
> If you think I am trying to fix a link that has been broken to K1UGM,
the
> answer is: YES.

I will shortly have Jim's 220 TNC for repair (I freely admit it took me a
long time to get it from him but it's not my property, it's his). Oh, I get
it! This means that if I fix this TNC, you'll stop telephone forwarding?
Outstanding!!! Where is my soldering iron...

>
> If you think I am different than you, the answer is: Yes

Remember, it's not just me. You differ from a lot of sysops in this area.

> Right now, the network as you know it suffers from these problems:
>
> 1. Broken Link from DSW to UGM

Taking care of that myself by building and maintaining.... Not by using the telephone. See above.

> 2. Broken link from UGM to RCI

Can't be helped right now due to a personal situation between parties. why don't you call Steve and work on a 220 link to RI instead of "examining net/rom encapsulated long distance tcp/ip protocols" on the telephone. Geesh! I understand he has erected a stacked array and has pointed it north. I can't get to it, can you (on the ham bands)?

> 3. Inefficient link from UGM to Provincetown

Then, let's get someone halfway in between to put up an amateur radio node to relay. Why is no one is interested in that? Probably think that the internet is faster and easier. Still it would be nice to have someone to experiment with in say Foxboro, or Marlboro. You could use the phone here to call somebody up and talk with them about the project.

> 4. No link to NS1N

I've been looking for someone to help re-establish it. I have all the gear necessary except for an antenna and tower space at the target.

> 5. No link to WZ1L

Bill's not interested. I waited and waited and waited for him to put equipment up.   I fixed stuff and gave him advice many times. He gave up.

> 6. No link out of KA1TUZ to anywhere except me

So. This is "broken"? Need redundancy? Use amateur radio.

> 7. No link from TR to CHSTR

This is a long standing issue between two stations who really should not be able to link but did. We think it's maybe a receiver problem at TR's site. He's working on it now that we've fixed CHSTR.

This next point is crucial and is the most important point of all I have tried to say these last messages. Notice that none of these problems - NONE OF THEM - is being solved by telephone forwarded traffic nor by "AX.25 encapsulation with IP". In fact, I tell you what -- let's go to each of these hams (K1MEA, K1TR, NS1N, WZ1L, K1UGM, KA1RCI, KA1TUZ) and let's ask them if their ham radio NETWORKING problems are going to be solved by "AX.25 encapsulation with IP packets" (telephone forwarded traffic).

> What is this all mean? beats me, but I am looking at solutions, and I told you
> what I think can work. Obviously, you have a solution, so at least you have an
> interest.
>
> We need new solutions, Herb.

Again, none of the problems are solved by your "new solutions". I'll admit - the internet is faster. You proved it. The telephone is faster - got more throughput through. Been proving it for many weeks now. Sadly, you made me an unwitting partner in the dissolution of the amateur network - duped me into cooperating with you which should have had my consent. Probably angered a great deal of my downstream forwarding partners (I heard from two of them by the way). In many areas of the country, telephone forwarders and people associated with them have been excised from the amateur network. You really ought to have asked me first (Hmmm...I wonder if you've asked UGM if he minds what you're doing). Alright, so now the experiment is complete, everyone knows it can be done. Internet system works FB. Phone network is the best in the world. Great accomplishment. Congrats. Everyone sees the benefits - nicely done.

But I'm telling you hams now want it stopped.

Thanks for listening.

I just happen to have that number available.
1357 messages, via HF packet links.

N6VV has that beat by a large margin, of course. During the aftermath
of the Loma Prieta quake, he handled over 6000 messages in three days
... on HF packet.

More robust protocols do a good deal better of course.

But that has nothing to do with the issue.
As usual the anti-radio folks attempt to divert discussion of the issue.

As usual, Ed is clueless.
He confuses "broadcast" with "internet broadcast protocols."
You will probably get a better answer via the TAPR APRS SIG.
Check at www.tapr.org
Folks have been doing this for many years. It's easy.

Personaly I feel the most important value is the "purity of signal". I don't recall the correct name of it, but it indicates that your signal is not overmodulated and is clean. PSKSBW 1.09 and I think 1.08 read this number out in the tuning scope any time the signal is idling. The help file explains it. I have seen some signals that decode with numbers that indicate they are sending square waves! They look a bit "rough" on the scope but I would not hav guessed they were that bad by ear or by signal reception.

Along with misconfigurations on about 60% of the stations, which results
in most of them beaconing their house that hasn't moved in 30 years, every
5 minutes or less... :-)

Of course it can be questioned if high traffic capacity is needed.
Usenet shows that no matter how far you increase capacity, people will
always use it up. The average quality of the messages will just decrease,
and their average size will increase.

In the early days, both on terrestrial packet radio and on pacsats, one
would come home and eagerly connect to see what interesting bulletins
there were. Maybe 30 of them on a good day.

Over time, their number increased but the fun reading them decreased.
Kill filters were required and built. But it became increasingly difficult
to receive content interesting enough to warrant the effort to weed it out
of the junkpile.

And so, a year or two, I (and many, many others) just quit connecting to
the BBS. My personal messages are forwarded to my station, and the
bulletins I just skip.

Of course there will always be enough users to send junk around, but the good days of discussions and useful information are gone. You won't fix that by increasing capacity. That will just make it worse.

The TAPR site at least had the following links:

YAM (Yet Another Modem):

http://www.microlet.com/yam/

BayCom (Bavarian Packet Radio Group):

http://www.baycom.org/

Apparently the Europeans have leapfrogged us(at least in the low-bandwidth digital world). Has anyone experimented with any of this stuff?

I wouldn't doubt that these guys just took the TAPR 9k6 Modem design, and put it on an FPGA!

Sorry if I seem like Rip Van Winkle, and am asking some old questions, and drawing some old conclusions - but I got out of the packet radio scene in '95, and just recently got back into it. It looks like TAPR has been sleeping too.

I'm I calculating correctly here? The price of the YAM PCB is about $10, and the FPGA will cost about another $15. I would assume the cost of the descrete components won't amount to more than about $5. So you can get the kit for about $30. That is FAR less than the TAPR modem behemoth's $80 price tag. If the European modems work - why does TAPR even BOTHER to sell this boat anchor anymore? This seems to be a disservice to the Amateur Community.

Am I wrong in asking "What the HECK is going on at TAPR?"

I'm more convinced than ever that they are only interested in their FHSS science project, and have lost all sight of the applications end. I feel like a dipshit for renewing my membership for $20(after letting it lapse for 5 years). Are these guys just a bunch of "high-compression heads" or what?

> space on their TH-D7A radio(not to mention a dual-band radio with two
> serial ports). Has anybody opened up one of these puppies yet?

My understanding (and I may be wrong) is that Kenwood designed
a special purpose IC containing the 1k2 and 9k6 TNC. They will
now include this IC many of their radios. For example, their
new radio covering HF through 1296 will utilize the same technology.

No doubt, there was some significant development cost in producing
this, but they are now the only one of the big three (YaeComWood)
with TNC functions in the radio.

I'm saying that developing this special application IC is an
investment not a major scientific breakthrough.

Maybe this will sell radios for them. Icom's gimmick (if you will)
seems to be these large color LCD displays. Yaesu, evidently,
doesn't need a gimmick.

It sounds as though you have a bone to pick with TAPR.

I do not have answers to your questions and I was quite

disappointed to see what happenned with the TAPR weather
station recently.

Could be historically that some other opportunities were
missed, as well.

But, let me say that TAPR accepts proposals for projects
and anyone (as far as I know) is welcome to submit one.

I think the fundamental limitation may be the motivation
of the membership and not any conspiracy on the part of
some ruling party within the organization.

Your point is well taken, though. Kinda like the old
saying "What have you done for me, lately?"

Oh, now I understand.
You know nothing at all about radio.

> But elaborating a little further, if someone does come up with an setup that

What concept?
Providing short distance (" ... in my area ...") RF internet?
It's trivial.
Many hundreds or perhaps even thousands of hams have done this.
Since 1984.

> Get someone clueful enough design/make the gear

Ah. You really *do* know nothing about radio.

Any US Ham who has supported TAPR in the last decade should have a SERIOUS "bone" to pick with TAPR. They didn't just drop the ball; They poked a big hole in it, and then sat on it.

> I do not have answers to your questions and I was quite
> disappointed to see what happenned with the TAPR weather

Yep: Everything TAPR has touched during the time "you know who" was providing "leadership" for that organization... TNC95 is another example not named so far in this thread. There are plenty of others.

> But, let me say that TAPR accepts proposals for projects
> and anyone (as far as I know) is welcome to submit one.

That's right. But by doing so, you are assured that your proposal will come to precisely NOTHING. Ham-Web, for example, was a brilliant idea that TAPR made sure would not happen by assuming control, then putting it into limbo. This is the usual pattern. Submit it TAPR, watch it die on the vine.

> I think the fundamental limitation may be the motivation
> of the membership and not any conspiracy on the part of
> some ruling party within the organization.

Under it's former (pre Greg Jones) leadership, TAPR came up with a good reputation for itself. After Greg came in, the hype level went up, and the accomplishment level went close (very close) to zero.

Blaming the membership is not going to change the facts. Sure, the TAPR membership was cheated, gulled, and ripped off. - But it was an internal clique surrounding TAPR's "leadership" that effected those nonproductive effects. THEY are to blame, not the people they systematically ripped off and lied to.

Blaming "Joe Ham" is typical "LandLine Lid" bull... Stick it. We Hams are getting sick and tired of that particular whine.

> Your point is well taken, though. Kinda like the old
> saying "What have you done for me, lately?"

TAPR has done one really outstanding thing, lately... They lost Greg Jones.

Now if they can get rid of his cronies and restructure with a new bunch of rascals, they MIGHT have a chance of getting their reputation (and usefulness to the Ham community) back again. The current BoD is too polluted with wrong thinking to help themselves. - They will just carry on with more of the same stupid, nonproductive thinking, tons of hype, and zero accomplishment.

Actually, the TNC inside the Kenwood, like the new Alinco, was OEMed from Tasco in Japan.

A 9k6 packet modem, in principle, is simpler than a 1k2 modem. That is because it does not modulate/demodulate but it simply (digitally) scrambles and descrambles the data. A lowpassfilter and a dataslicer finishes the whole thing up.

Single-chip designs (and other designs much simpler than the original discrete design) have been available for many years, but apparently not from TAPR.

BTW, after your "world chip", which was nice but overkill for packet, there has been an era when the TI TCM3105 was widely used for 1k2. It was smaller and required less power (and only +5V power). It was also available in SMD, and modems fitting in an RS232 connector were produced using that chip. Now, it is no longer produced (the chip makers, unlike radio amateurs, consider 1200 baud AFSK a thing of the past).

But it seems like the folks in the USA have missed most of this stuff.

Hi all, I had some very encouraging results from the relay tests I ran on Sept 9,00.

MFSK16 did very well indeed and we were able to get 100% copy on all the test that were run. I was running about 12 watts output to a inverted V dipole up 9 meters. This type of antenna could be set up very easily at just about any portable site.

One of the best samples of how well MFSK16 did is in message number 63 at:

http://www.egroups.com/group/psk31relay

Message 63 was sent from my Orlando QTH and received by Sandy, N2SF at his NY QTH - a distance of over a thousand miles!

There has to be some public service potential in that! The ability to send a accurate message more than a thousand miles using free software, a soundcard that most computers already have and a HF rig. Then have the message posted for public viewing quickly.

The only item that is required that a lot of hams might not have is a good laptop computer.

I run a Compaq 200Mz laptop and they can be bought used at very good prices.

It's pretty easy to justify the purchase of a laptop computer because they have lot's of other uses besides ham radio.

Well, that's all for now.

Dear reader,
Checkout our classics factory show on www.dancenet.fm every saturday 17.00
CET. If you can't listen at that time no problem, the show will repeated on
the sunday after

Saturday the 16th of spetember we have a special item around Ben Liebrand,
the remix master himself. Including an inteview and one of his famous
minimixes, and his personal top 5.

Tune in to www.dancenet.fm the number 1 cyber dance station.

Bullshit!

Ham radio is whatever you want to experiment with, that involves a radio.

It might be an Autopatch, an Internet, or a Part-15 Spread Spectrum LAN, or even another radio link; but, the Ham radio at each end makes it all Ham radio.

Anyone who says different is a filthy bastard.

Jimmy

If it only uses Ham Radio, throughout.

>

Gee! That's amazing how the telephone magically becomes an "amateur Radio"
station if you hook up a Ham Radio to one end or another of the telephone
link... I bet that works for signal flags too, huh? Can't wait to hook up a
10 ft. link between my handy-talkie and my telephone so I can "dial up" my
dxcc!

> Anyone who says different is a filthy bastard.

Yes, I can see how you have applied flawless logic to your alleged
"thinking" on this matter.  A proud day for amateur telephone!

Bob Lewis wrote that the "tail" built in to the Tx/Rx changeover was to hold the squelch at the receiving end. I feel that this is not of too great validity as it is only " putting off the evil moment" by 1 to 2 seconds and this would require very nifty action by the distant op to avoid a few junk characters from arriving. Many stations take up to 5 secs or more to reply. In any case, whereas squelch is fine on VHF/UHF channels, it is of little use on H.F unless one has condx of low noise/high signal/ minimal QSB etc.

It's magic folks!

Hook a radio to your telephone line, and et viola the entire world
telephone system becomes ham radio!

>
> I'm I calculating correctly here? The price of the YAM PCB is about $10, and the FPGA will cost about another $15. I would assume the cost of the descrete components won't amount to more than about $5. So you can get the kit for about $30. That is FAR less than the TAPR modem behemoth's $80 price tag. If the European modems work - why does TAPR even BOTHER to sell this boat anchor anymore? This seems to be a dis-service to the Amateur Community.
>

Has anybody here in the states bought/built one of these 'yam' modems?

I did not see any reference to a KISS mode, anybody have any more info than what's at the site listed??

I was into the 9.6k baud packet stuff for about 2 years till the guy running the local tcp/ip switch pulled the plug, I built and tested 2 of the TAPR 9.6k modems, modified and tested a couple of Motorola Micors to work with them. I am now looking to use something similar to do remote control via packet.

> I'm more convinced than ever that they are only interested in their
> FHSS science project, and have lost all sight of the applications end.

I heard that was on hold or shuffled off to some commercial use for a few to make bux on, and the amateur end was lost in the shuffle.

Hi all, I was recently advised by one of the WinLink2000 system
operators that WinLink2000 requires AirMail2000 in order to work.

----------incorrect--------
>you could use a standard terminal program - the commands that AirMail2000 uses
>are standard BBS commands much like what you would see on your local VHF packet
>BBS.

Only the older WinLink system that is no longer in use could use BBS
commands.

Sorry for the confusion.

What is the difference between using a telephone with touchtones to control an amateur station and what you're claiming? You seem to have this irrational fear of using the internet despite posting usenet groups which require the internet for distribution. Further, it's irrelevant to me how a signal is propagated if the means of propagation don't have a non amateur acting as control operator, so whether a signal goes through the internet, the ionosphere, or 3700 amateur UHF auxiliary stations is just of technical interest to me. Quite frankly, unless amateurs begin experimenting with things and finding new usages, amateur radio won't be around for long. What new usages have you got to play with that will attract 11 year olds? what new usages that will attract lots of technically inclined 60 year olds for that matter. Unless amateurs use amateur radio and find things to attract newcomers, it will die if just because there are no replacements for those who leave or die.

Interesting way of thinking. So if you have a radio, and plug it into something, then that something becomes Ham radio? That whatever you interface the radio with is really the defining object. Why would the telephone system become Ham radio?

If you plugged an answering machine into the telephone system, would
the telephone system become an answering machine system?

Well Art, what you suggest is kinda silly isn't it?
The hobby is about radios, not telephones.

What you propose is that hams use "new things" and avoid using
those "old things" like radios, antennas, feedlines, etc.

You have any clue how silly that sounds?

PART 97--AMATEUR RADIO SERVICE
Subpart A--General Provisions
S 97.3 Definitions.
(a) The definitions of terms used in Part 97 are:
(4) Amateur service. A radiocommunication service for the purpose of self-training, intercommunication and technical investigations carried out by amateurs, that is, duly authorized persons interested in radio technique solely with a personal aim and without pecuniary interest.

Now you've heard of it.

Where's the part that restricts an Amateur from interfacing it to another
communications system (e.g., a modem, a network, etc)?

Made it all up didn't you?

When exactly is the following communication not a radio communication service ? In all the following examples there is at least two transceivers communicating with each other using frequencies assigned to amateur service and obeying to the rules for amateur radio communications.

1) A battery powered HT with attached rubber duck antenna and built in speaker. This is a truly wireless case :-).

2) A transceiver with a built in antenna and external microphone and headphones (or a connection to a PC for RTTY/PSK31).

3) A transceiver with cordless (IR or RF) headphones and a cordless microphone.

4) An indoor transceiver with a coaxial cable to an antenna on a tower.

5) A tower mounted transceiver (e.g. Gunnplexer) with baseband audio cabling down to the shack.

6) An transceiver mounted in the attic of an apartment building with external antenna and audio connection down to the apartment using spare pairs in the apartment building internal telephone network to carry the audio down to the apartment of the operator.

7) The transceiver is at the top of a high building and the operator is connected to it from an other building using a telephone pair leased from the local telephone company.

8) The same as in the previous case, but the connection is over a virtual circuit over internet.

In all cases the transceiver is used to communicate with other amateur radio transceivers. In which case is the communication not a radio communication service ?

It is not amateur radio when these cases are modified to:

1) a GSM phone connecting to a commercial provider and you making a call to another amateur

3) a PC connected to the Internet and using cordless keyboard or mouse operating on amateur radio frequencies

6) a cordless phone is constructed to work on amateur radio frequencies and to make a phonecall while you are in the shack, using the cordless link to communicate with the base station in the living room.

8) an amateur radio link is used to connect a machine on the Internet (probably connecting to some chatbox, a voice interconnect etc) with a local operator using amateur radio frequencies.

The obvious difference between your examples and these, is that the main part of the link has nothing to do with amateur radio.

Phone patches are not amateur radio, and in fact they are only allowed in a few countries.   Most amateur radio license conditions preclude them, or in fact any other connection to other external networks.

>what's at the site listed??

The YAM modem is a MODEM, not a TNC. Thus, the reference to a KISS mode is irrelevant. It does modulate and demodulate the HDLC bits.

This is in fact a situation preferable over KISS.

In some situations, it may be useful to have a TNC with firmware running (e.g. for standalone telemetry stations, maybe for APRS although I have not seen suitable firmware for that, etc).

In the normal case, however, today's PCs have much more power than a TNC would have, and it is best to leave the AX.25 protocol handling to the PC instead of inserting a TNC between them.

US Digital Dichotomy!
by Charles Brabham N5PVL

Having trouble getting those last few contacts for your DXCC?

Use the Telephone!

It's easy! It's fast! It costs less! It requires no knowledge
or ability whatsoever!

Still can't talk to those rare and distant countries on 10 meters,
even with an expensive new tribander?

Use the Telephone!

Do you have NTS Health 'n Welfare traffic which must be moved to a
recipient several hundred miles away?

Use the Telephone!

Want to build an Amateur Radio Digital Network?

Use the Telephone!

Want to reliably communicate with distant Hams while radiating
a minimum of RF?

Use the Telephone!

For some strange reason, in every aspect of Amateur Radio except Packet,
it is widely recognized that using the Telephone is not an appropriate
response to the challenges we face as Ham Radio operators.
Everywhere else, there is an unspoken understanding that as Hams,
we are expected to be clever in our use of Radio and in the process
of overcoming those challenges, advance the art and better ourselves
as persons.

Why is it, I wonder, that the type of information we transmit
(Digital as opposed to Analog) makes any difference in this matter?
Why is it "OK" to bypass and undermine the use of Radio by Hams who
want to transmit Digital info, but not "OK" to do so for Analog stuff?

Is there a particular reason why advancing the art of Amateur Radio
in respect to moving Digital info is deemed to be of less importance
to us as Hams? Is there any logic behind the widely-held perception that
as long as you are handling Digital info, it doesn't really matter
(As a Ham) whether you use Radio to communicate or not?

In places where the regs specify that non-ham means of communication not be
allowed within the Amateur Radio Digital Net, there has been unchecked
progress and advancement over the last decade.
In those places where the use of Packet/Internet gateways have not been
regulated though, the opposite has happened and Network infrastructure
has been severely compromised while Hams have lost interest and heart
in large numbers. This is what has happened to the USA, Australia, and
other places where "packet hackers" have been given a free hand to
do as they wish.

I have read about FlexNet nodes in Europe which regularly handle
10 Megabytes per hour and more of traffic. That represents a high level
of both physical and technical development and advancement, along with
a high level of interest and enjoyment among the individual Packet ops
there.

The difference is infrastructure. Use the Telephone instead of Radio, and
infrastructure is what you give up. Sure, it's a challenge to build
a digital network; It's expensive, difficult, frustrating, and
sometimes appears to be impossible. The alternative though, is
the mediocrity which follows those who prefer to cop out, cheat,
and cheapen themselves while they undercut others.

I just don't see why our response to the challenges we face as Hams
should be different when wanting to move Digital as opposed to
Analog information.

I do not see why Hams using Radio is treated as being less important
in the US than it is in Europe.

"J. Hoffa" <J.Hoffa@underground.net> wrote in message

Notice how "Hoffa" doesn't identify himself, and has never mentioned a callsign?

Another non-ham SPAMMER, out to disrupt discussion by legitimate hams. If it weren't for his juvenile fascination with "potty language", I would suspect him of being employed by a corporation that would stand to benefit when Hams lose spectrum.

I think it's important that we realize that as commercial wireless Internet grows, we will be seeing more and more SPAMMING by would-be (wanna-be) wireless Internet "professionals" in the industry. I quote the word "professionals", because the REAL professionals have no need or desire to interfere with the Amateur Radio community. - It's just the ones who can't make the grade on their own who feel some great need to disrupt the activities and discussions of legitimate Hams.

Hi,

Today a pickup a president Lincoln. It's works fine but only on the CB band (26 to 28). Its look that the 10m band is disabled!!   There is a frequency shit 28.350 is 28.000 / 28.350 is 28.420 but only on the 10m band (I removed the frequency mod) Maybe I'm overlooking something???

Help!!!! Transceiver

> of overcoming those challenges, advance the art and better ourselves
> as persons.

Unspoken understandings? Interesting. The airlines had an unspoken understanding that passengers could hook up their seat-belts. After several were killed, they now force their crew to brief everyone on how to connect the two pieces of metal.

> Why is it, I wonder, that the type of information we transmit
> (Digital as opposed to Analog) makes any difference in this matter?

If you had been actually reading the messages, you would know that there is no distinction between analog and digital. There were examples of phone patches in previous postings.

> Why is it "OK" to bypass and undermine the use of Radio by Hams who
> want to transmit Digital info, but not "OK" to do so for Analog stuff?

There is no such "unspoken understanding." Analog voice is often interfaced to non-radio devices. Is this the dichotomy you speak of?

> Is there a particular reason why advancing the art of Amateur Radio
> in respect to moving Digital info is deemed to be of less importance
> to us as Hams? Is there any logic behind the widely-held perception that
> as long as you are handling Digital info, it doesn't really matter
> (As a Ham) whether you use Radio to communicate or not?

There is no dichotomy, analog and digital are both interfaced to other communications systems often, and easily.

> In places where the regs specify that non-ham means of communication not be
> allowed within the Amateur Radio Digital Net, there has been unchecked
> progress and advancement over the last decade.

References? Magazine articles, or studies of this?

> In those places where the use of Packet/Internet gateways have not been
> regulated though, the opposite has happened and Network infrastructure
> has been severely compromised while Hams have lost interest and heart
> in large numbers. This is what has happened to the USA, Australia, and
> other places where "packet hackers" have been given a free hand to
> do as they wish.

References? Most agree that packet radio died where commercial services became cheaper and better connected. In many places in the World, the communications systems are regulated and expensive, therefore the use of ham radio to bypass this system, makes it very profitable.

> I have read about FlexNet nodes in Europe which regularly handle
> 10 Megabytes per hour and more of traffic.

I've heard of the Easter Bunny. The obvious question is: where do they get this data from? What could possibly require 22 kb/s other than MP3 music?

> That represents a high level
> of both physical and technical development and advancement, along with
> a high level of interest and enjoyment among the individual Packet ops
> there.

It represents maybe 2 nodes out of 200. If the system were as good as you

"heard" then the commercial system in Europe would collapse as everyone
got a Ham license and bypassed that system.

> The difference is infrastructure. Use the Telephone instead of Radio, and
> infrastructure is what you give up. Sure, it's a challenge to build
> a digital network; It's expensive, difficult, frustrating, and
> sometimes appears to be impossible. The alternative though, is
> the mediocrity which follows those who prefer to cop out, cheat,
> and cheapen themselves while they undercut others.

Infrastructure? How many long distance nodes has your club put up?
How many have you personally put up, that are still operational?

> I just don't see why our response to the challenges we face as Hams
> should be different when wanting to move Digital as opposed to
> Analog information.

There is no dichotomy. It's all in your mind. The phone patch is often
used on HF and VHF.

> I do not see why Hams using Radio is treated as being less important
> in the US than it is in Europe.

Europe is not a good comparison. Most of the countries are socialist,
and the high tariffs are what make Ham radio bypasses cost effective.

I listened around for other stations, but haven't heard any as of yet.
It is quite a distinctive sound though! Sounds like a piccolo :-)

What's a good freq that everyone hangs out on?

The topic involved using the telephone system to avoid or
bypass ham radio links. You have even *one* example
where a life was saved using this technology?

I thought not.

Vely Intelesting. Unfortunately, it was in Japanese! BTW, I can read
Chinese(and by extraction, I little bit of Japanese).

But that was very interesting information. Thank you!

Not really. Just that I feel like a dolt for supporting them.

To be fair, I may have gone a bit too far when I blasted them for still including their 9k6 kit on their web site, because some good might come out of it if experimenters use it to build their own working model to copy and put into an FPGA. However - they ought to make it very clear that is ALL it is good for; otherwise they are just ripping of unsuspecting hams.

> Your point is well taken, though. Kinda like the old

Even the in many ways outdated relevant portions of Part 97 (USCFR 47) allow control links for example, and remote operation. Further try as I might, I can't find any section of said rules barring let's say sending the audio from a receiver to another point for retransmission if the original signal is lawful on amateur radio. I'm less offended by folks who want to for example set up a linked set of repeaters using the internet as part of the link mechanism (I am of course assuming adequate security measures so that non hams can't get access) or as the means of sending the audio and control signals.

Your argument is sort of the equivalent I used to hear from simplex operators about repeaters, namely that if the signal couldn't be heard directly by the receiver/antenna combination, it wasn't worth worrying about. I note that simplex operation on 146.52 while traveling gets few responses too just so you can see a possible flaw in the logic already.

My point is that unless hams find some way of attracting folks who want to experiment in lawful ways, it just becomes a way of building things others have already been doing for quite a while. Hams aren't pioneering in the greater than GHz range, most in fact have to use surplus outdated parts just to get on in that region. Hams in this country aren't setting up their own licensed wireless large scale high speed (in the greater than one megabit range) LANS or finding new means of communicating either. PSK31 is a great thing to play with, but all too many folks seem to have to buy a rigblaster to interface the rig to a soundcard, rather than building their own. You apparently prefer the present setup, and I'ld rather see folks trying new thing interfacing one amateur rig via the internet to another than folks who have to have guidance on how to hook up a soundcard properly to an HF rig. The internet is here, I'ld love to be able for example to be able to talk with friends in let's say Chicago from where I live now just using a handheld rig let's say, but it's not

going to happen soon, we don't have the infrastructure, it could be possible using internet relaying to solve some of the problems, but for some reason, you don't like that solution and deride it. Face it, people now can talk and communicate with folks in foreign countries via the internet via IRC, netmeeting and various and sundry voice and typing equivalents, and they can do it much more reliably than I could ever have done it using HF propagation. Why not make use of that capability and still encourage folks to use amateur radio?

The common misunderstanding seems to be that one group argues that interconnection should be allowed to attract new people, and the other group argues that routing a qso via the telephone is not amateur radio.

I think the second is certainly true.
The first may be true as well, but when that is the case we should not discuss the allowance of those extra links, but the introduction of a new hobby that allows such interconnections.

In fact, here in the Netherlands it was already introduced a decade ago, and it was called MARC. It is equivalent to what you US guys call CB.
It is a license-free radio communications hobby, and the users are allowed to do anything they like (talk, send music, do packet, use profane language, you name it) as long as they don't modify the transceiver output power and don't use directional antennas.

Maybe you need a similar system?

Rob

The rules don't "bar" it. That was not the argument.

No, it is not similar.
You are confusing the internet with radio.
Please think about it.

> My point is that unless hams find some way of attracting folks who want to

Exactly correct. Such high speed network *cannot* compete with
the internet links that have become the standard way to connect one
ham radio digital system to another here in the US. When one attempts
to set up such networks, there is no traffic for them to carry: it gets
there first via the internet links.

Please think about this.

> PSK31 is a great thing to play

Perhaps just ignorance on your part, but I *certainly* do not "prefer" the
present setup. After spending five years building digital network, and then
watching it be destroyed over the next ten years, you bet I don't like the
"present setup". There was a lot of experimentation going on ten years ago
before a few (and eventually quite a few) hams took it upon themselves to
destroy that network by forcing the traffic to go over the internet instead.

Please think about this.

> and I'ld rather see folks trying new thing interfacing one

> going to happen soon, we don't have the infrastructure, it could be possible
> using internet relaying to solve some of the problems, but for some reason,
you
> don't like that solution and deride it.

See above. When you use the crutch of the internet to avoid doing the
hard work of building ham radio capability ... that capability will *never*
get built. There is no longer any reason to build it.

If you want to talk to Chicago with your HT, start convincing hams to build
some links from (wherever you are) to Chicago ... using ham radio.

If you want to talk to Chicago, use an appropriate ham band.

If you want to talk to Chicago, build your remote base that let's you use
your HT to control your HF station, and talk to Chicago.

I've heard your "justification" for avoiding ham radio over and over.
Sounds just as silly now as it did ten years ago.

> Face it, people now can talk and
> communicate with folks in foreign countries via the internet via IRC,
> netmeeting and various and sundry voice and typing equivalents, and they can
do
> it much more reliably than I could ever have done it using HF propagation.
Why
> not make use of that capability and still encourage folks to use amateur
radio?

What would you encourage them to do?
Why would they want to do that?

No point for them to get on HF, they can *already* talk to you using the
internet.

No point for them to build HF-linked-voice-repeaters, they can already
talk to you using the internet.

No point for them to use radio at all is there?

Unless of course what you are interested in is RADIO.

    I guess I worded my question wrong. I did see drivers / etc. to be able to
setup and operate this 'modem' in different modes. I guess I should have asked if

there was a DRIVER available to operate in KISS mode. It seems to be a less expensive alternative to the TAPR modem and looks to be less components so easier to assemble.

There a third group that I belong to, that argues for interconnection because it is legal, it is part of the hobby, and it is enjoyable. How I see the arguments
against this, is that it is not pure. That operating without interconnections is the only way. That my enjoyment would be greater if I joined their clan.

Is the group I belong to going to produce something better? I don't think so. It is just a hobby. Nothing will become of it, because few participate.

I remember a quote from General Patton which says: "If everyone is thinking alike, then no one is thinking." Something to that effect. What he meant was, that no new ideas could be developed, or that ideas which could seize the day would be stifled in a self imposed, conformal, and righteous group. He hated "Yes Men" and I concur. "Yes Men" are bad; bad, bad...

You can picture this purity group all huddled in a corner throwing sneers every now and then, and rejoicing in their purity even though everyone else is enjoying their hobby in a legal manner. It is not peer pressure, because none of those imposing purity could ever rise to this third groups level.

But none of these groups is really going to produce anything of value. If Internet prices in the U.S. tripled, there still wouldn't be greater numbers of HF and VHF links. That part of the hobby is over. There is no amount of Ham data that requires this network or link. It goes against hobby communications, and that is why it fell apart (not to mention that it was buried under a half-ton of WW messages from Brazil and West Africa).

9k6 modem can occupy just a part of some custom chip ...

Way back when ('86?), Telereader put pretty much a whole
TNC-2 into a single gate array. So the digital part is "easy".
The analog part requires a mixed-signal custom chip, but
that's no longer a big deal.

So Based on that logic the Phone Patch on the local repeater is not Ham
Radio.
So I can use it as I please. Order Pizza, Call the office and check
messages etc.

Ham Radio is what ever you make it.
It's not just CW & SSB on HF. That's the beauty of this hobby the ability
to experiment with new technology. It's that experimentation in
new technologies that will keep out bands. If we don't make the inovative
technological leaps we have been know for we will loose the bands to
comercial interest that will spend Billions of dollars for the frequencies
we have used for years for free.

What's funny is that some of the TCP/IP hams are still active on the air, one way or another, while most of the folks I saw opposed to such usage have become big users of things like ICQ, and usually just gabbing on the internet.

Hams had occasional unreliable TCP/IP networks, and tried to used the internet to solve lots of problems, the only problem is that all too many folks got interested in web pages, and the other goodies on the internet. I know all about the horrors of trying to keep an RF only system going, and it ain't pretty when a necessary link drops out, or your connection path is marginal to non-existent when there are leaves on the trees. While hams conceivably could build a nationwide RF equivalent to the internet, it would still be reproducing what others are already doing better and with more capability, and were doing better with mostly RF (remember that the "M" in MCI stood for Microwave). It might be desirable to build such a network from some points of view, but the need has been apparent since at least 1985.

Sorry, but we couldn't for example do this conversation via packet without huge long delays, and a good chance that responses would either never show up or show up days later. Just as hams probably have to get over thinking that it can impress the public by being a non-commercial western union and use CW to send lots of traffic from state fairs and the like, we've got to get over the sole dependence on straight RF paths unless we can actually set them up and maintain them in Brightest Day, and Blackest Night, coldest weather and scorching heat. Besides, our biggest investment in RF infrastructure, namely two meter repeaters seems to be slowly becoming boxes with occasional users at rush hour, and otherwise they're quiet for all too many of them. In fact, I can hear three machines near me that on weekends might not ever get a voice repeated through them. Repeaters, even 9k6 TNCs or soundcard programs aren't going to attract folks with DSL or cable modems as innovative and new things to experiment with, and neither is a system dependent mostly on 1200 baud packet signals being relayed unreliably.

May be legal for you, for me it certainly isn't. My license conditions
explicitly state that I am not allowed to do this.
And so do most of them.

I don't think it is fun, either.

Rob

Which is fine, you're not missing much.

Our rules allow it, and that's the end of that argument. So we can close
this stupid, semi-annual, thread for now.

Over here it has been legal since 1997 to connect an amateur transceiver to other networks. The traffic must still be amateur radio traffic, so phone patches are out of the question.

There has been some talks about repeater linking or remote repeater receiver linking, but as far as I am aware of, the problem has been getting any network connections or leased lines at reasonable prices to the repeater sites.

>I don't think it is fun, either.

In countries where you have active clubs within line of sight paths
the situation may be different, but when the population and ham
density is so low that it is hard to find active clubs within reliable
2 m path distances, maintaining "pure" networks requires quite a lot
of masochism.

Does an external DSP noise filter or an AF stage DSP in the rig make any difference in copying digital modes with a computer using a soundcard? The computer has to do DSP processing to retrieve the information anyway and I suspect that it does a decent amount of noise reduction processing in the process, so it would seem to me that the external DSP would be superfluous. In fact, I could see where there might be some artifacts of the A/D and D/A process that could even make things more difficult for the computer.

As others have pointed out, they've integrated a small OEM TNC from Tasco Japan.

>
> The old 1200bps Amateur TNCs have a special modem chip(but most of them
> are still huge because nobody bothered to upgrade the technology in the
> last 5 years - save PacComm with the picoPacket). The old 1200bps
> modem chip has been available for years(since the 80's). I believe it
> was put out my AMD, and was called the "World Modem Chip" because it
> did both Bell 202(old European 1200bps telephone standard, and ham
> packet standard) and Bell 212(old American 1200bps telephone standard).

The World Chip came in a huge 28-pin DIP. I suspect there wasn't enough demand to offer it in a smaller surface-mount package, but the majority of the bulk was the package, not the chip. The only technology that needed "upgrading" was the packaging.

However, the TCM3105 modem is/was available in a small-outline, surface-mount package and also uses a single +5V supply (unlike the World Chip which requires a negative supply as well which adds bulk to a product).

> But the TAPR 9k6 modem has a bunch of discrete stuff, the thing costs $80 for a kit - and the thing is HUGE! Are there now commercially available modem chips(or chipsets) that will do the job for 9k6 packet?

Sure there are commercially available modem chips for GMSK 9k6. MX*COM makes several suitable chips. The TAPR design is kind of neat if you want to learn how a 9k6 base-band modem works, though.

> The TAPR 9k6 modem works well. Evidentally, it works better than its predecessor the TAPR K9NG 9k6 modem(I believe it is based on the G3RUH design, which is superior). However, it is MUCH bigger, and much more expensive($80 vs. $35) than the old K9NG. Why didn't they just work on improving this design - getting the cost and size down? Now that handheld wireless is becoming a reality, and the need for small, inexpensive and reliable 9k6 modems is upon us again - TAPR is left to play "follow the leader", when they could have had a 5 year jump on the industry!

I don't believe the TAPR modem performance is *that* much better than that of the K9NG modem, but TAPR's modem has a better interface to the TNCs. The TAPR modem is similar in some respects to the G3RUH modem but lacks a couple of features - the G3RUH modem permits pre-distorting transmitted data to compensate for receiver distortion, and the G3RUH modem has a fairly sophisticated clock/data recovery design. The pre-distortion feature was neat for point-to-point links but not practical for the real multipoint world, the clock recovery scheme was good.

What good is a 5-year jump in the Amateur Radio packet industry anyway? I don't know if you've noticed, but extrapolating 5 years into to the future, there may not be any packet radio products being made. Hams are kind of fickle when to comes to experimentation and the simple fact is the the wireless professionals are *way* ahead of packet. The cold, hard truth is that hams were excited to send data at all and were totally hung up on the neatness of sending data, and that's not what is exciting. Services, what it does for you, are what is exciting, and services require an infrastructure and services architecture. Ham radio has the BBS system, DX Packet Spotting Cluster and APRS. The only service that benefits from being done via radio is APRS and that's remarkable because it is effectively a one-way service.

Does the Alinco Tasco TNC have the same bug that the Kenwood Tasco TNC does?

That is, on AX.25 connections made using the TNC (not via KISS, but using the
TNC's firware), all frames essentially are sent with the Poll bit set (even when
not
necessary), and the Tasco TNC does not have an acknowledgement timer! The
Tasco TNC simply does not send acks until it hears a frame with the Poll bit set.
In a connection where both ends are sending I-frames, the ack will piggyback on
each sent I-frame, but that's not a common use case.

This means that one Tasco TNC will talk to another pretty well (every I-frame is
ack'ed immediately in response to the always-set Poll bit), but a Tasco TNC
talks poorly to other TNCs. Since the Tasco TNC never acks an I-frame that
doesn't have the Poll bit set, the Tasco TNC is *always* waiting for the other end
to time out and send a RR(P) before responding with an ack.

If you connect to a packet BBS to read messages, the throughput is very poor.

I wrote Kenwood a letter about this but they've totally ignored it as far as I can
tell. Maybe I should put together a web=page with a packet trace on this topic.
The same problem is known to be present in the TH-D7 and TM-D700.

Dana,

When I talked to Jeff Rienhart at Dayton, he said that the first version of firmware they had from the Tasco people did have the same problem as the Kenwood, it would transmit, but not receive. he said that the second revision fixed it.

My guess is if it's in the current version of the Kenwood radios, it'll be in the version for the Alincos. I'll get Tim to give Naki at Alinco a call and see if he is aware of this.

Has anyone played around with trying to get the YAM modem working with Manchester-encoded 2400bps? The Flexnet drivers only support 1200 and 9600 operations. I don't know about the Linux drivers, but I would be most interested in them as they come with source code!

Could the YAM be used at 2400bps with unmodified commercial ham radios? This would avoid the problem of having to modify radios to hook directly into the varactor and discriminator.

Is it best to order the YAM's from Nico Palermo's site?

http://www.microlet.com/yam/

Does the PCB come with all the discrete parts other than the FPGA? Is it better to get the FPGA along with the modem, or just get the FPGA here in the USA through someone like DigiKey?

If Nico's PCB doesn't come with discrete parts, is it possible to order them thru someone else? The following site mentions that a kit can be ordered:

http://www.infracom-fr.com/yamg.html

If Nico's PCB doesn't come with all parts, does this one?

I would really appreciate feedback on this.

What about the Surface Mount Device(SMD) version of the YAM modem:

http://www.qsl.net/dg1scr/pr/yam/index_e.html

What ever happened to this? I don't see anyplace to order it online.

4.8kb is better. There is a 4.8kb soundcard driver for FlexNet. Soundcards

```
are even cheaper than YAMS, and come pre-assembled, ready to go.

I remember the NNC. In fact I can look to my right and see one on a shelf right this minute. It is 64180 based, with 256 kb of static memory, 2 floppy drives, and a SCSI port (which AFAIK no one ever used). It has 4 HDLC ports, and a daughter board carrying 4 modems (alas, only 1200 baud).

Besides the units sent to software developers, 6 were sent out for field tests. This is one of them. There were components for another dozen which were never shipped. A friend of mine has those. He got them when TAPR was selling off surplus and obsolete inventory. (I don't know why, I suspect he just wanted to corner the market on a bit of nostalgia.)

The NNC was a technical success, but it was the victim of mass market economics. The one I have is still functional. But the rapidly falling prices of PC clones made the NNC an uneconomic choice for use as a network packet switch.

After careful consideration, GRAPES decided to deploy PC clone based switches instead of using the NNC. PC clones were about as cheap, and much easier to maintain in the field because replacement parts were as near as the corner clone store.

The NNC would have done the job for us then (though not after we moved to 56 kb). But because the NNC was single sourced in low volume, it wouldn't have been economic to maintain a large scale high reliability network built around them.

TAPR couldn't have known when they started development of the NNC that PC clone prices would plummet so quickly, and so sharply. But they did, and that put an end to the NNC as a viable network switch.

Hi All,

I am looking for a TNC that is small and capable. New or used. Price is not a big issue.

It must be able to handle HF and VHF an all or most modes.

If you have any suggestions or one for sale please let me know.

Thanks in advance.

Carlos

Let's make sure we're talking about the same problem; the TNC in the
Kenwoods will not send an ACK for an I-frame until prompted (via an incoming
frame with the Poll bit set) to do so by the "remote" DXE ?

Frankly, I think it's a very bad bug.  It really kills the utility of the
Kenwood
radios as client nodes.  I'd like Kenwood to acknowledge the problem and
offer me a fix for my still-under-warranty radio.

> My guess is if it's in the current version of the Kenwood radios, it'll be
> in the version for the Alincos. I'll get Tim to give Naki at Alinco a call
> and see if he is aware of this.

That's very interesting.  Someone actually admits this is a problem!
(it is, of course, but I get the impression Kenwood is looking the other
way).  Alinco should absolutely refuse to ship radios with such broken
TNCs, or at least explicitly explain the issue to buyers.

Are you saying that 4.8Kbps will work with an unmodified radio?  I
remember people running K9NGs with Mocom-70s at 4800bps - but I'm not
sure if they modified the beasties.

Anyway, the original question still stands - will 2400bps(or 4800bps)
work well with most radios, without modifications to the radio?

> There is a 4.8kb soundcard driver for FlexNet. Soundcards

Yes.  But it would be pretty hard to fit a soundcard into my $150 Palm
mp100.  However, you bring up a good point - I think some of these Palm
devices are starting to come with sound capabilities.  But I think they
are only in the more expensive models($300+), and I'm not sure that
they have sound input capability.

Hi Mark,

I find that using a an external DSP can be beneficial. My DSP 9+ has a fixed audio output which I use to feed the soundcard (previously PK-232). The filter allows me to reduce the back ground noise and/or band width. With the soundcard software you can see the resulting changes on the waterfall display. Also with the waterfall I can see where the filter is and move the desired signal, even with the narrowest band width.. I never found the DSP to be near as useful for digital mode when used with the PK-232. Being able to see where the desired signal is on the waterfall and scope displays make the difference in the usability

CSS and GoList work together for the Dxer's benefit.

Muscle Shoals, Alabama. September 11, 2000: Creative Services Software announced that they have reached an agreement with The GoList to provide a bundled package of the Log Windows logging software and The GoList . The package will include the latest version of Log Windows and a one year subscription to The GoList

The Log Windows/GoList bundle retails for $119.95. It will also be part of the Digital Trio package from CSS, which retails for $189.95. Cross upgrades from release 3.06.50 or greater to the GoList subscription are $60. A cross upgrade for current GoList subscribers to Log Windows is $60.

Log Windows is owned by SCO, Inc and is maintained by Creative Services Software.

Creative Services Software is at http://www.cssincorp.com
The GoList is at http://www.golist.net
The Log Windows homepage is at http://www.logwindows.com
SCO, Inc is on the web at http://sco.home.mindspring.com/lw.html

Windows, Windows 95, Windows 98, Windows Me, Windows 2000 and Windows NT are Registered Trademarks of Microsoft Corporation.

>TNCs, or at least explicitly explain the issue to buyers.

On the Dutch packet network, someone outlined a bug in the KISS P-Persist
mode.  He claimed that the "persistance" value was implemented backwards,
i.e. a low persistence means a high probability to transmit, and a
persistance of 255 means the TNC/Transceiver will *never* transmit.

This makes it useless for Dama operation with software that sets the
persistance to 255 automatically.

Can anyone confirm that behaviour?

You would not operate it in KISS mode, but use a driver specific to the YAM
modem and the mode of operation you want.

It's just so disconcerting to see conversations like this. It's pretty obvious that the "friendship and goodwill" portions of ham radio are now history. Why can't everyone just learn to live with others? If there's a repeater in your vicinity that is hooked to the Internet, and you don't like it, just don't use it. There a hundreds of different aspects of Amateur Radio, there's no rule that says that you have to do all of them or agree with all of them. There's many different drummers out there.

As to Internet repeater linking, lets step back a few years. There are/were quite a few repeaters taht have been linked using non-radio links. No one thought that this was bad. Automatic and manual phone patches have been a major part of Amateur Radio for years.Automatic phone patches have fallen in number, not because they are bad, but because cell-phone use has proliferated.

And as to using radio for all of the links in an "Amateur Radio" system, what about the connection between the microphone and the trasceiver? That's wired. Does that mean it's bad? Not to me. So why does hooking a few transceivers together with IP make it bad? What if by hooking up a lot of repeaters to IP, we could create a network that would allow you to roam across the US and still talk to the Amateurs in your home town. Would this be bad?

Let's look at ways that Amateur Radio and the Internet can enhance each other. There's been many QSO's made that couldn't be made before. Why? Did the Internet carry the signal? No, it's because it let two people meet each other and arranged a schedule for the QSO. The Internet is providing the capability for those who ARE working on new technologies to communicate with each other, like this thread originally was.

It just makes me sad to see that there are so many people who would rather sit here and call each other names than to get out and do something good. If you are into defending Amateur Radio so heavily, why aren't you out talking on it instead of hear cussing at others?

Ed

Were 9k6 modems ever developed for the NNC?

<chomp>

I have some pix, schematics, and source code for the alpha version of that design. They are lurking in a file storage box somewhere around here.

There were a couple other architectures under consideration.

One had no floppy or hard drive support. I argued that floppy support would be a "good thing" because it would make it easier to load firmware compared to the serial port/parallel port schemes that were also considered.

The hardware design I liked best would have used a small rack type box with a backplane and 4 - 12 slots for SBC card, modem cards, floppy, and possible future extensions (e.g. ip router card). That design didn't fly, looked too expensive.

As you pointed out, the availability of cheap PCs removed the need for NNC hardware. However the software part of the project died along with the hardware part. Had the software part of the project continued, we might have had something different than NET/ROM as the common L3/L4 protocol, and might have had native ip routing from the start.

There were a bunch of other netowrking projects that started about this same time. TEXNET, ROSE, the Southern California effort (forgot names/calls).

Some of us would like to forward packet traffic over long haul links, both on VHF/UHF and on HF. The folks who bypass those links using the internet prevent us from doing so. They refuse to halt this practice and allow the hams who *want* to use radio ... use radio.

Those are the folks who killed the "friendship and goodwill" .

Note that your "different drummers" are not drumming on radios ...

I am not "talking on it" because the traffic I wanted to handle over a long
haul
VHF link already got to it's destination via a link across the internet.

I am not "talking on it" right now because what I tried to do on HF
did not work due to the recent solar flare, and at this moment there
is no propagation to anywhere from the PNW.

I am not "talking on it" right now because the person I wish to talk
with on VHF has not left his office yet.

If you can't keep up, just say so.

We kept waiting for the high bandwidth network to appear. All we ever saw was 1200 and 300 baud. The BBS scrotum scratchers insisted on using AX.25 on HF, in the face of technical evidence against it. We put up our node, and waited. No other Ham group could be found to "interconnect", so we formed a better backbone on the big "Interconnect." It's still running today, although for the life of me, I don't know why. AX.25 Packet radio is dead. Voice and other digital HF modes have replaced it.

When you have to deal with idiots as an alternative, the Internet looks very inviting.

The Internet is where it is happening. The vocoder available from DVSI, and homebrew Speak Freely, allows repeaters to be interconnected and encrypted between nodes, to prevent outside access. Part 97 only allows encryption on satellite command channels, so many of the aux channels are easily jammed, which forces many repeater groups to use the internet.

4800 is normally run on FM with discriminator and direct FM taps.
Police departments use this on their car computers, and it works
pretty well.

Thanks Steve, that's interesting.

What about 2400bps? I remember that in the early 90's, a few of the TNC manufacturers started to market 2400bps TNCs - which pretty much took off like a Lead Zeppelin. In particular, I remember Kantronics had one, and it seemed to sell the most units. From what I can remember, they worked pretty well with stock, unmodified radios - but there was some kind of compatibility problem amongst the different TNC manufacturers.

I suppose those early 2400bps modems were AFSK modems, though. The YAM modem uses Manchester encoded FSK. Don't the pre-emphasis and de-emphasis circuts wreak havoc with an FSK signal(therefore the need for the discriminator/varactor taps)? Would it help at all that the signal was 2400bps FSK instead of 9600bps FSK?

I had a KPC-4 back then, and it did work (I seem to recall it being QPSK). The problem was that 2400 wasn't worth the expense. The speed increase was offset by the long latency times (most everyone used simplex). Maybe if they made the data rate 2400, and sent 1200 with FEC through it, it might have improved some of the long haul links.

I'm not sure why some people using the Internet prevent you from using long haul links. On my radio, I can talk on HF or VHF and not have any worry about what other people do.

And I certainly hope that you aren't talking about broadcasting packet messages across the US, that's a really inefficient use of spectrum.

But more importantly, it seems as if you are saying that Amateur Radio is slower than the Internet. Well, this just isn't true. If you are talking about the transfer of AX.25 packet data, then indeed, that mode is slower. But my radio signal is often many milliseconds ahead of an equivalent voice over IP solution.

But isn't it obvious that 1200 baud signals are significantly slower than 56kb and even faster connections? To compare the two is not a smart thing to do.

Ed

Ed, before you reply, it might be nice to read what you are about
to reply to, and perhaps even try and understand it.

> I'm not sure why some people using the Internet prevent you from using long
> haul links. On my radio, I can talk on HF or VHF and not have any worry
> about what other people do.

That is why I ask that you THINK ABOUT IT.

Here is what I said:

> > Some of us would like to forward packet traffic over long haul links,
> > both on VHF/UHF and on HF. The folks who bypass those links
> > using the internet prevent us from doing so. They refuse to halt this
> > practice and allow the hams who *want* to use radio ... use radio.

Do you understand the above paragraph?

> And I certainly hope that you aren't talking about broadcasting packet
> messages across the US, that's a really inefficient use of spectrum.

You use ham radio for what you want, I'll use it for what I want.

> But more importantly, it seems as if you are saying that Amateur Radio is
> slower than the Internet. Well, this just isn't true. If you are talking
> about the transfer of AX.25 packet data, then indeed, that mode is slower.
> But my radio signal is often many milliseconds ahead of an equivalent voice
> over IP solution.

Amateur radio is slower than the internet, for LONG HAUL links.

> But isn't it obvious that 1200 baud signals are significantly slower than
> 56kb and even faster connections? To compare the two is not a smart thing to
> do.

I did not compare them.

Once again, Steve displays the fundamental ignorance and disregard for
others that typifies the "LandLine Lid" way of looking at things.

At least they were open and above-board about it. When the Land Line
Lids began to build the bypasses, more than one of them told me that
they intended to destroy the ability of the existing network to use long
haul ham radio links, and that there was nothing anyone could do about it.

Pretty expensive.  Most repeaters need a club to share expenses and
get tower space donated.  OKC had a non-profit corporation formed
for this purpose: (OPRA) Oklahoma Packet Radio Association.  It got
about 3 members.  Well anyway, money doesn't grow on trees, as
they say...

Or run cross-band. I don't know why more people didn't do this. It is
so simple AND cheap(at least if your not on some radio-active hill).
Gets rid of all those cavities and duplexers - and only adds the
expense of some extra feedline and a second antenna - both pretty cheap.

> I had a KPC-4 back then, and it did work (I seem to recall it being QPSK).

I tried to do some web searches to find info on 2400bps packet ops. I came up with a big goose egg. The only thing that looked hopeful was some old mail archive index of packet information from 1991/92 that used to be stored at ftp.ucsd.edu (apparently some Brian Kantor-maintained stuff). The index is still reachable, but all the files seem to have been blown away.

KPC-4, huh. Well I knew that the KPC-2400 did 2400, but not the KPC-4.

QPSK, huh - that IS different. I sure would like to know the whole story. Looks like this is all lost technology. Even the TAPR back issues don't have much info - although I suppose the review of the KPC-2400 in Nov. '87 might be of some interest(at least it would verify whether it was FSK, AFSK, or QPSK).

> The problem was that 2400 wasn't worth the expense. The speed increase was offset by the long latency times (most everyone used simplex).

... and I would think the error rate would increase. It seems that

2400bps is right on the edge of what will work with most off-the-shelf, unmodified voice radios. In the lab, it probably worked OK, so these high-compression heads went ahead and tried to market it. So, the result was the proverbial "Lead Zeppelin".

> Maybe if they made the data rate 2400, and sent
> 1200 with FEC through it, it might have improved some of the
> long haul links.

Yes - THAT is a good idea. FEC... how about Interleaved Reed-Solomon?! You wouldn't even have to lower the data rate to 1200. Maybe just by 5-10%, or so. I've got a YAM modem coming. It comes with a Beta driver for the Manchester Coding FSK 2400bps implementation - but I would need to get the source code for it to implement the error correction. I'm entirely capable of doing this.

wrote:

>Some of us would like to forward packet traffic over long haul links,
>both on VHF/UHF and on HF.

So there are some hams to want to do some things but they live at a
large distance so they can not get it done their own. Now, there
appears to live some hams at suitable places in between and their
assistance would be helpful to get the link going. However, these hams
are not interested of that kind of operations for some strange
reasons. e.g. because it would just be hard work and no pleasure for
these intermediate hams. Now, the original hams call these hams with
all kinds of names because these hams in between don't want to play in
the sandbox exactly as the original hams wanted.

>The folks who bypass those links
>using the internet prevent us from doing so.

Do these take away all to frequencies or the good sites, thus
preventing some radio only connection ?

From the discussion so far, it appears that the reason for this name
calling is that other hams refuse to provide the intermediate relay
stations that would enable the original hams to play just the way they
wanted.

>They refuse to halt this
>practice and allow the hams who *want* to use radio ... use radio.

As far as understand, you are still free to set up and maintain your
own relay stations in more ore less inaccessible places, why don't you
do it yourself ?

>Those are the folks who killed the "friendship and goodwill" .

Requesting others do devote all their free time to do things that they
are not interested in, just to please some other hams and let them
play exactly as they please without considering others, is quite a
broad definition for "friendship and goodwill" :-).

THERE is your mistake.  You should not have been waiting, you should have
helped building it.  High bandwidth networks do not appear by themselves.

HAPN 4800 bps works OK without modifications to the radio, just connections
to it.
(i.e. you don't need to modify PLL time constants, filter bandwidths, etc)

THAT would be a good thing for YOU to do.

> Here is what I said:
>
>>> Some of us would like to forward packet traffic over long haul
>>> links, both on VHF/UHF and on HF. The folks who bypass those
>>> links using the internet prevent us from doing so.

Here is where you make a fool of yourself. If the link does not exist, NO ONE can "bypass" it. And if the link exists, having someone else bypass it does not have any effect on your ability to use it. Any traffic siphoned off by this alleged "bypassing" only leaves more spectrum available for you to use.

>>> They refuse to halt this practice and allow the hams who *want*
>>> to use radio ... use radio.

Which of these evil people came to your house, held a gun to your head, and ordered you not to use your radio?

> Do you understand the above paragraph?

Better than you seem to.

>> And I certainly hope that you aren't talking about broadcasting
>> packet messages across the US, that's a really inefficient use
>> of spectrum.
>
> You use ham radio for what you want, I'll use it for what I want.

Yeah, right. Isn't that what the repeater jammers always say. And the folks who want to hold a local QSO on a long established net frequency? And the lids on both sides of the maritime phone patch debate? Of course you can "use ham radio" for whatever you want -- at least until the FCC figures out a way to enforce "good amateur practice."

I don't believe that long haul packet is necessarily abusive, but I do have to agree that it IS (at best) "inefficient use of spectrum" -- I also know that SOME packet traffic handlers have CHOSEN to be abusive, but of course I assume you don't support that.

>> But more importantly, it seems as if you are saying that Amateur Radio is slower than the Internet. Well, this just isn't true. If you are talking about the transfer of AX.25 packet data, then indeed, that mode is slower. But my radio signal is often many milliseconds ahead of an equivalent voice over IP solution.
>
> Amateur radio is slower than the internet, for LONG HAUL links.

True. And inefficient. And unreliable. And expensive. But who cares as long as you get to use amateur radio any way you want to.

But why do you think that the mere existence of a quicker, more efficient, more reliable, cheaper way to send the same traffic somehow prevents you from using the slower, inefficient, unreliable, expensive method of your choice? Could it be that you are not really talking about what YOU can or can't do, but rather arguing about that someone else should not have the same right to "do it their way"? Could it be that these bypassed links that you are whining about are no where near your station and you have no connection to them -- so you are simply whining about how someone else chooses to pass traffic at his station? You sound like a diehard CW operator complaining because someone else far down the line passed one of "his" messages on phone instead of keeping it pure "CW" all the way from origin to delivery.

If you want to keep your traffic pure and unsullied by the evil internet, find enough like-minded people and establish your own routings. Nothing makes you route traffic into an internet gateway. Nothing makes you route traffic to a station that you know is going to route it through a gateway. If you would rather have your traffic garbled and lost to protect it from being tainted by those dreaded wires, then you need to route your traffic to someone who will love and cherish it like you do - someone who would rather destroy it than deliver it. But while you are at it, don't forget to set up a system for handling the volume of service message traffic back to the originators informing them that their traffic died enroute.

And, NO, I am not one of the people running (or even using) a gateway to the internet. I'm just a ham who thinks I should be able to use amateur radio the way I want to (within regulation and good amateur practice) without someone else trying to limit MY choices of how I use MY station.

Wow, talk about selective editing. How about you go back and re-read
the entire paragraph shithead.

Here's the rest of the paragraph:

        We put up our node, and waited. No other Ham group
        could be found to "interconnect", ...

What you're saying is we should have built the entire network. That's
not how it's done. Without an investment in the system, it has no
value.

>
>Were 9k6 modems ever developed for the NNC?

Not specifically. The modem daughter board connects to the HDLC ports with ribbon cables which have the normal TAPR modem disconnect pin out, though, so it is no big deal to fit separate 9.6 kb modems to the NNC. I had a couple of G3RUH modems hooked to mine at one time to form a 1200/9600 cross connect. Of course I had to fabricate a way of mounting them in the box. I removed one of the floppy drives and put them in that space.

The NNC could keep up with one 56 kb modem, but not two. That's about

on a par with the 12 MHz 286 PCs we used as our first switches. The 64180
is a super Z80, and quite efficient compared to the PC architecture. We had
to go to 386 PCs (motherboard transplant) to handle multiple 56 kb modems.
The NNC could never have been upgraded to handle that. Some of those
original transplant 386 switches are still in service.

As I recall, 2400 bps was done with a 600 baud AFSK signal, same as 1200 bps, but with 4 level modulation instead of the 2 level modulation used for 1200 bps. So the radios would pass it just fine, but the path had to have a better SNR to maintain the same error rate. Since lots of amateur paths in use were marginal, this was a problem.

But the big problem was that only Kantronics produced a TNC to do 2400 bps. This sort of single sourcing has caused many otherwise technically sound developments to not gain large scale amateur acceptance as network components. Amateurs are rightly fearful of winding up with an unsupportable orphan. If a couple of the other manufacturers had jumped on the 2400 bandwagon, it might have supplanted 1200 as the basic AFSK packet speed.

As someone pointed out, the improvement in throughput of 2400 over 1200 is small because the turn around latency is still large for a system intended to use a FM voice grade radio. 9600 was much better primarily because it forced amateurs to use purpose built data radios (the TEKK, and similar) which also offered the quick TR and rapid receiver recovery necessary to see the benefit of the higher speed. (Those who persisted in trying to shove 9600 through voice grade FM radios were disappointed with it too.)

Try reading what I wrote.
I like to build long haul links.
There is no "middle" involved.
There are only two ends.

> >The folks who bypass those links
> >using the internet prevent us from doing so.
>
> Do these take away all to frequencies or the good sites, thus

Please think about the issue.
It is not possible to pass traffic to someone when that trafffic
has *already* been passed to them, against their wishes, over the internet.

> From the discussion so far, it appears that the reason for this name
> calling is that other hams refuse to provide the intermediate relay

Totally wrong.
Please read what was written.

MURS is not a cell based system.  It is a technologically simplistic
point-to-point channelized system, several technology-generations
inferior to amateur radio.  I thought you were the fella hyping
what "technically aware" would do if you could just find a few 12-year-
olds to help you out.

It appears that the command-line-capable version of WinLink is being
phased out. The new version requires the use of specific software, (WL2K)
and does not appear to work with anything else. The WinLink team may,
according to the latest information on some of the web sites, add the
command-line capability back into the software in some future release.

If you want to pay for the service, there are commercial AirMail
providers that might do what you need.

Hmmm ... urls didn't get into my first reply.
Here are some places to look for commercial services.

http://www.pinoak.com/

http://www.downwindmarine.com/sailmail/sailmail.html

A Google search for "AirMail", "SailMail", "PTC-II", "WinLink" and
various other keywords will provide a lot of information on what is
out there, and how it is evolving from the Ham Radio test/development
mode into commercial use.

> You used to have such a thing in Southern California.
> Isn't it there anymore?

I was shocked when I recently went to LA! There is no Ham activity at all! I finally picked a repeater and stated my call, and waited for a response. It just morse code ID'd and that was it.

Hmm, try another one. "You probably don't know, but this is a private repeater." OK, sorry, try another one. "Hey buddy, are you new in town? Any idiot would know this repeater is private." Oh, sorry, tried another 5 and got morse-code and voice ID's.

Got on 146.52 and stated my call. waited 5 minutes and stated it again. "Hey mutha-fucka, stoopid shit, we don't want to rap whiff none oh dat white trash fum back east."

Silence. Nothing else heard in a half-hour scan.

Hmm, must be a baseball game in town or something...

Time for the FCC to take all that wasted spectrum back to "we the people..."

Jimmy

Using TCP/IP as the communication protocol, and "cell" hubs connected
to Internet thru cable modems/DSL connections - there is no reason
a "cell"-based system can't be made to work.

One of the biggest problems with the 2m Amateur packet systems was(and
still is) the existance of high-powered, wide-coverage "high-level"
nodes.  With one of them on a channel - it basically becomes unusable.
In the Los Angeles area; 145.01, 145.03, 145.05 are perfect examples of
this(K6VE seems to be the biggest blow-hard).  At times these "blabber-
mouths" even affect San Diego and Riverside/San Bernardino Counties.
The 2W ERP and repeater limitations actually assist the "cell"
technique - they do NOT "cripple" it.

> I thought you were the fella hyping
> what "technically aware" would do if you could just find a few 12-
year-
> olds to help you out.

Why not.  All most hams know how to do is argue, criticize, block
progress, and put up old-fashioned high-power jamming stations - so
that they can be king-of-the-channel.  Building functional
communication networks seems to be one their lowest priorities.

The protocol makes no difference at all. You have to build the RF part of
the network correctly before you can run ANY protocol over it!
Why this focus on using wires instead of radio? Why not connect
the cells together using radio links?

Please read past comments about cell based ham radio networks.
You need to hook the cells together, using super-cells, and hook
the super-cells together, etc. This is well-known technology, just
not used by the cell phone people (because they use wires to connect
the lowest level cells together). What you described is simply a network
topology designed by someone who has not paid attention to work
done in the ham radio networks 15 years ago. It ain't hard to build
WORKING wide area ham radio nets. But you do have to think
about how you will create small cells, and then how you will create
large cells to hook the small cells together, and then how you will
trunk those large cells together from city to city.

You mentioned only 2M frequencies.

Your solution seems to be "I don't know how to figure this out,
so I'll just punt and use the telephone company instead."
There IS much better (RF based) technology available. No, I don't
mean commercial frequencies, or anything like that. I mean reasonable
network topologies instead of the junk you described above.

Oh bull. Hams know how to build network, and have proved it in Europe,
and in some parts of the US. The "Gee, let's just use wires instead of
wireless."
folks sure make a real mess of things! Pure laziness in my view.

The reason why K6VE is there is because he is the ONLY ONE LEFT who is holding things together. Remove his system and the entire packet network for Southern California dissolves. (Also, K6VE's system is not on ALL THREE of those channels.) As for his ERP, his station's location, being AT HIS HOUSE on Mount Wilson, will virtually guarentee an effective ERP greater than 2W, unless someone forces him to use a milliwatt radio (most amateur equipment comes with 1W min. [HT's] or 5W min. [Moblies] in that frequency range). Try working with him, not against him, and see where that gets you.

As Hank Oredson says in a different response, just how do you expect to "glue" your cells together without some sort of backbone or meta-cell?

Also, what's the deal with using just 2m? You treat it as if there are no other digital amateur radio allocations whatsoever.

I will admit, you're not the only one with the 2m problem. There are allocations reserved for the DX-packetcluster operations on 6m and 223 MHz that go unused by them, yet the SCDXC still insists on using only 2m, including many simplex frequencies beyond those reserved for them. This angers many people, especially those who are trying to use those [non-reserved 2m] simplex frequencies for VOICE (for which the bandplan says they are).

...And speaking of that, just why haven't you voiced your opinion before one of the Southern California digital amateur radio organizations? Instead of complaining about it, do something about it.

Hi all

Looking for info on the mode known as THROB, specifically what frequencies
can it
be heard on and what does it sound like.

any help would be appreciated

Jim VE9WH / VE9TTY

I forward with K6VE, KM6RZ and N6IYA in California (40M, CLOVER).
Without those folks, and a very few others, the entire California network
would be totally dependent on the internet for it's connectivity.

And instead of complaining about those "crowded channels", put some
radios on air on some other frequencies.

> That's 25.6 Mbps total bandwidth required of the ham radio links.
> However the ham radio system connects into the internet must
> supply this bandwidth. How could that be done? Who would pay?

yes, I am suggesting higher speeds than are available via modem. We
would use the same cost structure as an ISP in that you purchase
bandwidth in bulk and then oversell that bandwidth. Think of it as
buying shares in a T1. At any given moment how much bandwidth you get
is not guaranteed but can range from nothing to the full pipe. Part
of the appropriate use contract would be the ability to deny bandwidth
pigs or at least charged them more for using more data.

To use your example of 100 users in the community, the end-user link
would be 256 kilobits per second. Guaranteeing them the full

bandwidth all the time would be very expensive proposition. However, if you purchase a T1, you can oversell a 256 kbps chunk of bandwidth 25 times which is a reasonable oversell factor for high-speed service. This means, at worst you would get 10.24 kbits per second which is slower than a modem but the condition would not persist. It's also possible to give people sufficient information so they can judge whether or not to even try.

Yet another option for dealing with bandwidth issues is to put a cap on any given user's bandwidth during peakload but this is to be rather messy. I personally prefer more "personal" persuasion methods. ;-)

we already have a model for paying for a shared resource. How do ham repeaters keep operating? By volunteer labor and by club members paying dues for the service. The same would be true for a community access Internet service. It would take volunteer effort as well as club members paying into the communal pot.

At this point, I expect some naysayers to raise the "tragedy of the Commons" issue. It would be possible to develop an authentication protocol which uses various ecash protocols to "pay-as-you-go" for the bandwidth. It would allow you to pay for the bandwidth use so that bandwidth pigs would be charged more.

Like a repeater club, if the members don't participate, the network will fall apart. It's probably a kinder death than the ones I have seen in the corporate world when an organization should just close the door and turn out the lights instead of struggling to keep going.

I would expect also using a mixture of ham and part 15 equipment. I think hams would do best at providing backbone type services with part 15 equipment used for the last 200 feet. Proxim FHSS cards are reasonably cheap ($130 retail).

interesting idea. I hadn't thought of it that way but that could work.

it all depends on your definition of "low bit rate". Anything under
megabit is, by my definition, noise. I look at megabit radios as
being low bit rate.

> > It would be good PR.

> else gives up after being associated with other Hams for any length of time.

that's the way it is but is not the way it has to be. There are
several radio clubs my region (PARC, BARS, MMRA to name a few) but I
don't go to the meetings. Heck, even in clubs I am active in, I don't
go to meetings. granted I'm a poor example, but I believe that it is
possible to change that behavior and demographic.

> > It would attract technical people into the hobby.

well actually, it was his screwing someone else that got me where I am
today. Although, he did have an ugly tower in the backyard which was
used for a wind generator back before they were "popular".

I think I fit the definition of an aging, overweight white man with an
ugly tower in the backyard play with low-tech radios (and some
high-tech radios) better.

In the usual sense, he has a great location - but for the cell concept,
he has a bad location.

MURS is kinda on 2m(~156Mhz), and that is the only personal service
that allows digital AND business comms.

However, I've got both 2m and 70cm amateur radios(lots of 'em), and a bunch of UHF-based FRS/GMRS stuff too. In general, I prefer the propagation characteristics and reduced feedline loss of VHF vs. UHF. The main reason that I even started using 70cm was because 439.025 was/is the defacto 9k6 standard channel is SoCal.

Actually, it really isn't a complaint, but an observation that high-level nodes are a drawback when it comes to backboned systems.

I'm pushing for a medium-speed(~9k6)public wireless voice/data network using the Internet as the backbone. The fact that amateurs can't do business communications is a major drawback in establishing such a network on ham frequencies. I'm just pointing out that, because MURS offers both business AND digital applications, and is limited to low power(but not too low) with no repeaters - it is a better choice than ARS for establishing such a network.

Now that MURS is going to become a reality, you KNOW that Radio Shack, Motorola, et. al. are working on something like I'm talking about. Hams could actually "beat 'em to the punch" by moving their 9k6 stuff over and "staking a claim".

Modified Part 15 devices on 2.4Ghz sounds cool - but there is that little problem with "no business" communications that throws a wet blanket on things. Besides, feedline loss is a "killa" on 2.4Ghz, and the scuttlebutt is that propagation characteristics are less than desirable.

You have a cite for that number? I think it is way off the mark for current internet users. That's 100 users "active online" not "100 users signed up for the service".

Perhaps you should remove rec.radio.amateur.digital.misc from your crossposting, since this is simply not something that can be done using ham radio. It is a commercial service you are talking about. Has nothing much to do with this newsgroup.

Totally wrong.
He has a perfect location for a top level cell, which connects super-cells,
which then connect local cells. (Assuming you architect with three layers
of cells, as has been done in the successful ham radio networks.)

So what? This is alt.radio.amateur.digital.misc. MURS is off topic.
You want to go commercial, there are *tons* of different frequencies
available, in *many* different bands. Build whatever you want, or
lease it. No big deal.

> However, I've got both 2m and 70cm amateur radios(lots of 'em), and a

"... the ... channel ..." ???
Only one cell for all of Southern California?
No wonder it doesn't work!

Um ... "high-level" (by which I assume you mean "wide coverage"
and not "high-ERP") *are* the backbones. Duh ...

> I'm pushing for a medium-speed(~9k6)public wireless voice/data network
> using the Internet as the backbone.

Why do you persist in avoiding RF solutions?

There is *no* radio networking involved at all. It's just one little
tit off the internet serving one or a few users. Trivial. Old stuff.

First done over ham radio in 1984 for heavens sake!

What you suggest is simply totally trivial. You hang a TNC and radio
on your computer. Load your choice of *NOS software. Finished.

I have some spare radios and TNCs. Let's try it.

The whole task took me about ten minutes to accomplish on the
computer in the other room. Now it links that computer to the
internet over a 9k6 link on 424.750 to this computer.
Whew! That was hard! Oh neat! I can browse web sites via radio!
(The radios are TEKKs running 2W into dummy loads.)

If you want to build a commercial network, do so.
It's off topic for this newsgroup.

Can anybody give info on the possibility of reducing the delay when switching from Tx to Rx on Digipan 1.2.   From Rx to Tx is no problem but Tx to Rx is slow and if any other macro or whatever is attempted before changeover is completed, various oddities may occur.   If the delay is necessary, why so.
Cheers from 3D2BA.

Ahhh... but you have to *pay* for a license, and the radios aren't
cheap, and there aren't common nationwide frequencies, and you would
have the problem of high-power high-level nodes...

... and how do you figure it is off-topic? This is a good segue - no
MURS newsgroup exists yet. I'm not even sure that the FCC report and
order is final, as there is very little information available on it at
the FCC site. My guess is that Radio Shack, Motorola, and company,
want to keep this thing under wraps - so that they can get a leg up on
the competition. I'm trying to tell people about it so that they
can "stake their claims".

EXACTLY! And now that you can't bitch about the *commercial* content -
because it is MURS and not ARS; you try to say it is "off-topic".

Handheld voice/data wireless communications is the RAGE right now.
This is "where its at", as far as radio is concerned.

This newsgroup is about amateur radio.
MURS has nothing at all to do with amateur radio.

No cites because it is empirical. You oversell bandwidth until people start to complain then you add a little more bandwidth. Publicized oversell ratios are frequently lies. In the dial-up ISP world, small pops oversell at a 10 to 1 ratio. very large-scale pops (2000 modems+) oversell at close to 30 to 1. The math behind this is based on queuing theory.

the world gets different when you're talking about ethernet type competition for bandwidth versus competition for a phone line. You can use very high oversell rates because traffic tends to be bursty and you can interleave on a time basis to achieve overall higher utilization of the channel.

> Perhaps you should remove rec.radio.amateur.digital.misc from your crossposting, since this is simply not something that can be done using ham radio. It is a commercial service you are talking about. Has nothing much to do with this newsgroup.

let me bring things back to the original point. I argued that amateur radio should be able to provide/carry traffic for community access Internet. In theory, one should be able to do with a commercial service but you can't in practice. There are no licenses left for deploying such a wireless service. All of the big players are sitting on the LMDS/MMDS licenses until they can figure out how to deploy a service that will generate them billions of dollars to pay the overinflated auction based license fees.

because the FCC lets licensees play "dog in the manger", there is significant pressure to dig up more spectrum. Guess where is going to come from? within the next five to ten years, I believe amateur radio will lose most of the spectrum above 440 to commercial interests. The only way to stop it is to occupy it. Converting more taxi radios and filling the bands with idle repeaters isn't going to help.

I want to keep amateur radio around for a while and doing interesting things even if it means slitting the throats of a few sacred cows.

this means thinking outside of traditional roles and operations such as providing datacomms for underserved/not profitable communities (ie rural and 2/3ed tier cities, university researchers, poor schools etc.)

I'm asking you to not just think out side the box but to punch holes in the side and climb out.

ABSOLUTELY.

> I want to keep amateur radio around for a while and doing interesting things even if it means slitting the throats of a few sacred cows.
>
> this means thinking outside of traditional roles and operations such as providing datacomms for underserved/not profitable communities (ie rural and 2/3ed tier cities, university researchers, poor schools etc.)

That will help - but I think the big "killer application" is instant handheld access to e-mail/newsgroups - even web pages(Motorola and RS know this). While I'd like to see amateurs allowed more freedom to access commercial Internet sites - I don't see how to make sense out of it, not with the way Hams banter about things. It is better to just allow free access in another service. MURS is the first service that fits the bill(albiet with only 5 frequencies). Near 2m, it is on a fairly reasonable frequency(above 300Mhz, you start to get a lot of feedline loss), and the 2W ERP limit is totally reasonable for a Internet-backboned network. And, best of all, there can be no debate over "commercial" Internet access.

> I'm asking you to not just think out side the box but to punch holes in the side and climb out.

I am also irked by the "unused/underused" repeater syndrome. There is so much more Amateurs could be doing there. With respect to digital usage, I've been trying to get Amateurs to think differently for a few months now. Maybe it is just the "vocal minority", but my take is that, in general, veteran amateurs and the ARRL always opt for the status quo. It aint worth fighting with them over this stuff. For example, when presented with reasonable options to the old outdated Morse Code requirements, they would NEVER compromise. Belatedly, and much to their consternation - the FCC finally did something about it and lowered the old 5/13/20wpm reqs to 5wpm across the board. Of course, the "end-of-the-world" predictions about the second coming of CB weren't true - but they will NEVER admit that either.

For the most part, I think most of the veteran amateurs don't care that much about their VHF/UHF allocations. Once all the possible dedicated repeater frequecy pairs were "staked out", and any attempts to get allocations for digital applications were "snuffed" - the "battle" was over, and all their excitement went out the window. Other than a few well-maintained good-coverage repeaters, 2m/1.25m/70cm/33cm/23cm/13cm are wastelands. Like the Morse Code fight, the "old boys" ended up winning a battle - but also like the Morse Code fight, they will "lose big-time" in the end. I am thru trying to fight these fools - I would RATHER have the VHF/UHF amateur frequencies put to good use, such as they are in the other succesful free/nearly free public services such FRS/GMRS, and hopefully MURS. The FCC learned their lesson with CB (stay away from skip, and insure manufacturers don't produce radios/equipment that allows jamming/harranging to be easily acheived), and in recent years they seem to be doing things right with respect to the public radio services. If MURS shows that it can work out, then I expect to see some portion of the virtually unused VHF/UHF Amateur spectrum be converted to free public services(I would fight attempts to auction it off), where it can be put to good use. A conversion of 50% of the VHF/UHF frequency allocation sounds like a good starting number.

```

It's NOT the only 9k6 channel in 70cm. 438.950 - 439.075 (in .25 steps) are all 9k6. There are also a handful of 9k6 allocations at 431 MHz. If you prefer 2m, then why didn't you go with 9k6 on 144.99 MHz?

Modified part15 devices on 2.4GHz usuallyjam legitimate, WELL-DESIGNED amateur operations on 2.4. Right now, I've got an interference issue up there with a neighbor's 2.4 cordless phone that has yet to be resolved.

Also, if you don't want the LA County Sheriff's conditional permit to become permanent, you should advocate PROPER amateur use of the band. Most 2.4 equipment made under part 15 are a bit too wide banded for proper use.

[2.4 lan stuff will go outside of our band. 2.4 cordless phones sometimes suck up an entire MHz - too wide. Many problems with conversions.....]

<horseshoestew@my-deja.com> wrote in message news:8p8rd3$dbo$1@nnrp1.deja.com...

>tons of mindless crud snipped<

Yah yah, blah blah... I've heard a goodly number of geekoids, over the years, sing the same old tired song about how stupid Hams are, how stupid the ARRL is, etc etc etc.. How we ought to use the high bands more, blah blah blah.

(Yawn)

Not one of them ever DID anything useful, not even to further thier own alleged "cause"... But they sure are good at carping about everyone ELSE!

Ignorant jerks. After hearing this same old tired crud for so many years, followed up by ZIP, by way of action along the lines they allegedly propose, I've come to the conclusion that this particular brand of blowhard is only there to SPAM legitimate discussion of Ham radio issues, and attempt to drag Hams down to their own sorry level. Many of the loudest ones work for companies that would stand to benefit if Hams were to lose heart and lose spectrum. - Thus their rabid negativity, followed by ZIP, by way of constructive ACTION.

(Yawn)

It's best to ignore them. This geekoid is a prime example of what Ham Radio could do with a lot less of.

Um ... yes ... that is what the citations would show, it is called
"measurements."

For the reading disabled: "100 users" above meant "100 users active at the same time from one community." Assume they all run Napster or Gnutella.

This was intentional: I left it ambiguous (100 what?) to see how the responses would run. Nobody took the obvious reading of "100 active users". Wonder why that is? Because MURS is totally useless in that case. In fact, there is probably NOTHING a hobbiest could build that would support such use.

Who will pay for the T3 link to cover the radio bandwidth?

Exactly right. He would need to purchase a controller that is useless
for anything other than Pinoak. All the other SailMail providers I'm
familiar with use off-the-shelf PTC-II as their "preferred" controller.

Some appear to support PACTOR as well as PACTOR-II.

Didn't find any that support CLOVER or CLOVER-2000, but only
spent 10 min. or so doing the search, and did not do specific search
for CLOVER or HAL.

I'm actually from Riverside/San Diego Counties :) That's one of the
biggest reasons I don't go to the SCDCC meetings anymore. That, and
the fact I usually stay at my place in Rosarito on the weekends.
Believe it or not, I can hit ELANOD(East LA node) super-reliably on
145.09 in one hop from Rosarito(~140 miles) thru a beam using just 5W.
It is amazing what you can reliably accomplish on 2m with a clear
channel.

Wow. Do you see any solutions in the near term?

I heard somewhere(I think it was on TAPR's Spread Spectrum mail list)
that 900Mhz devices "do better" than 2.4Ghz devices, as far as
propagation is concerned. I think someone mentioned an "evil"
multipath problem. Are they just covering their asses for choosing
900Mhz for the FHSS radio project, or is this a legitimate concern?

Do you really think that the fine folks at TAPR would put all the work they

do into promoting digital radio, then promote 900 MHz if it was second best
because one TAPR project uses 900 MHz? The leadership at TAPR cares very
much about what they are doing and I have confidence that if they are
recommending 900 MHz, it is not to cover their butts over the 900 MHz FH
project.

Ah, but it was GREAT for learning the TCP/IP protocol! You could
actually WATCH all the handshaking going on - ESPECIALLY the

retransmissions that you don't normally see on an Ethernet :) Once I
convinced everyone in our area to turn ARPing off, 1200bps
TCP/IP "kinda worked". At 9k6, TCP/IP over AX.25 actually starts to
become usable.

Of course not!
Thus it's name (Simple Network Operating System).
As in K.I.S.S.
The goal was to give me a platform to play with various protocol ideas.
Which is what I'm doing right now.

> Actually though, most of the people in this group wouldn't know what Linux
was,

Circa about 1984. I was able to connect to Phil's system now and again
from where I lived up near Boston.

The "tcp/ip folks" left 1200 baud and moved to the internet.
Darn few of 'em can manage to create even a minimal RF network anymore.

You bet! Fabulous discussions going on there! I was amazed!
Even better than the high end of 75M.

> Do you really think that the fine folks at TAPR would put all the work they do into promoting digital radio, then promote 900 MHz if it was second best because one TAPR project uses 900 MHz?

After watching the "fine folks at TAPR" actively discourage Amateur Packet Radio networking for years, insisting that Packet Radio be totally dependent upon the Internet for all "networking functions" instead, years after this policy was shown to be self-defeating and sverely counterproductive, nothing they say or do surprises me.

> The leadership at TAPR cares very much about what they are doing and I have confidence that if they are recommending 900 MHz, it is not to cover their butts over the 900 MHz FH project.

I would say that TAPR has a "chance" to recover, now that Greg Jones is no longer President of that organization, but I have seen the shape Greg left TPRS in, (The Ham organization he "headed" prior to his move to TAPR). GOOD managers leave an organization in better shape than when they first took the helm.... Greg's ego doesn't allow that, so he tends to leave them in a shambles. - Like TAPR is today.

Give Greg's cadre of butt-kissers and LandLine Lids a few years to hit the bricks, and TAPR just may recover and once more become a fine Ham Radio organization. Until then, don't put your money on TAPR coming up with ANYTHING actually useful. You'll get lots of hot air and hype from them, but no usable, useful results. That is the "LandLine Lid" way, and THAT is what has lost the US it's leadership position in the world of Amateur Packet Radio.

The European Packet Radio net is at least ten years in advance of the US "net" now, and to a very large degree, this can be directly traced to the activities of TAPR under Greg Jones' alleged "leadership". Greg is gone, but his moronic, self-defeating policies remain. I'd like to see a fast recovery, but am not optimistic after seeing what happened with TPRS. (Texas Packet Radio Society)

Remember the NNC?

TNC-1, then TNC-2, then NNC, which was planned to give the
hardware base upon which we could build networks. That was ...
... without digging out my NNC architecture diagrams and looking
at actual dates but relying on memory ... about 1985. As far as
I know, none were actually built, although a few boxes of similar
design were created by more than one group. Nothing comparable
to the TNC-2 done since then.

When did TAPR become divorced from Modular Mining?

A few days ago,i posted for info on a good/ez-to modify 440mHz rig for 9k6 pkt.

A ham replied about a rig from Azden that did 9k6 out of the box,but
couldn't remember
the model number.Anyone remember?
tnx de dave-n2rhl

Right. Someone who has done some experiments with TCP/IP on amateur radio
(beyond copying the autoexec from a friend and asking for "TELNET NUMBERS"
on the BBS) knows a lot about the effects of the basic parameters.

What happens when you change the MTU, Window, initial retransmission
timeout. What is the difference between fetching two files sequentially in
one FTP session and fetching them simultaneously in two parallel sessions.
What is the difference between packets dropped by transmission errors and by
congestion. How is the routing done (what is a subnet). What is ARP
doing, and why. Etc etc etc.

Knowledge of things like that is invaluable when troubleshooting today's IP-based networks. You may be able to learn it from a well-paid commercial trainer who probably has never seen a network analyser himself, or you can learn it using amateur TCP/IP.

A decade ago, you would have done that with NET or NOS, today you would use Linux. But the result is the same.

Rob

PSK31 requires a (1 second, I think) tail of single tone at the end of a transmission. This is likely the delay you are experiencing. It is required to lock the squelch on the other end so that the receiving station does not get a bunch of random characters from the noise immediatly following the end of your transmission. It is not a good practice to eliminate this "tail".

Does anyone know of a PSK program that will run under Windows 2000? Do they
all access the DSP hardware in a way not allowed under Win 2000?

Thanks

for yr 2000

personally I've spent 600$ on slovinian 1.2mb/s data radio partial kits. another member of NETCPA has spent about $800 on fully built kits. a third member is buying the parts, building the partial kits, and testing them. we should be looking for test paths in a month or two (or three...).

with any luck by this time next year, we'll have megabit paths in operation. end user paths are still a problem but there are some solutions in the works.

> It's best to ignore them. This geekoid is a prime example of what Ham Radio
> could do with a lot less of.

you want less of people that do something constructive and that can play nice with others?? boy, you do want ham radio to fail.

I have done some limited testing of my WinPSKse on Win2000; I also know of two or three folks who are using it that way also.

Log Windows 3.07.30 released!

Update adds many new features

Muscle Shoals, Alabama. September 8, 2000: Creative Services Software announced that version 3.07.30 of the popular logging program Log Windows has been released.

Log Windows 3.07.30 includes the following new features:
- Support for Top Ten devices band decoder
- Support for Alinco DX-77
- Direct support for the Icom IC-706 MKII
- Stop rotor function for HYGAIN and Sartek rotors
- Browse function for PSK mode (in search options)
- Added option for W4CSS parallel interface (5th message with MFJ Voice Keyer)
- Direct Support for the Rotor-EZ
- Added Grayline windows display.
- Added DXCC2000 reporting support.

And has the new features of the 3.07.XX releases:
- Telnet DX Cluster Access
- Support for new radios, including the IC-756 and the Ten Tec Pegasus (direct and GUI support)
- New logging mode options
- IOTA Support
- WinQSL QSL Manager Support
- QSLMaker 2.3 QSL Printing Program Support
- Full ADIF support
- Support for the W9XT CW keyer
- Support for the K8CC parallel port interface
- Icom-718 support
- TenTec Pegasus GUI control support
- Sartek Rotor support

"If someone purchases or upgrades to LogWindows 3.07.30 now, they'll not only get all the future 3.x upgrades, but also a FREE upgrade to the 32 bit version of LogWindows when it becomes available. So for minimal investment now, they are saving money in the long run", said Rick Ruhl,. President and owner of Creative Service Software.

The product retails for $69.95 and upgrades from release 3.06.15 or earlier are $40.00. Those who have purchased version 3.06.50 or greater will get this upgrade free. It also appears on the Digital Trio CD . It is available from dealers around the world, as well as direct from CSS.

Log Windows is owned by SCO, Inc and is maintained by Creative Services Software.

Creative Services Software is at http://www.cssincorp.com
The Log Windows homepage is at http://www.logwindows.com

Windows, Windows 95, Windows 98 , Windows NT and Windows 2000 are Registered Trademarks of Microsoft Corporation

> How would the ham radio system access the internet, other than
> via modem?

How about a linux box plugged into an OC3?

> How would the hams get this higher speed access to the internet,
> so they could share it in the community?

Ill do it..

> However the ham radio system connects into the internet must
> supply this bandwidth. How could that be done? Who would pay?

Ill do it.. Ill pay.. I doubt that any rf network could easily flood the bandwidth that I can get hold of. If anyone can build a high speed RF network and supply me with something that can be plugged into a linux box somehow, and make it legal, Ill get a large chunk of bandwidth to play with..

Do you already have a 9k6-capable TNC? If not, I don't understand why
anyone would pay more for a bulky single-band Radio AND TNC
combination, when the Kenwood TH-D7A does it for a little over $400(and
dual-band to boot).

Am I missing something here?

Interesting concept you guys are discussing [just came across it via alt.radio.family]. A similar thing has been done on a housing estate [project] in Manchester, England - where a bunch of residents all clubbed together and set up a WAN in the whole block, which links to the Internet via a high-speed leased line. It started off as a wired service [they ran CAT5 all about the building !] but now they are experimenting with wireless access to the units. Our Radiocommunications Agency in the UK permits short-range wireless LANS so this can only operate within the block, but I suppose its a start.

If any of you are interested I will try and find their website which discusses the project...

When you want anything beyond AX.25 keyboard qso's, you will have to use
the KISS mode.  That sucks.

To be seriously usable for 9k6, it should at least do 6PACK.

Rob

That's the whole point: if some ham can connect into the internet,
so can everyone else around them. High speed links that hams
might provide could span perhaps a few miles to maybe 50 miles.

Useless.

Not to mention the fact that it requires a Sonet *modem* to
plug that OC3 into some computer.

Cool!
How ya gonna get that RF network to me?
Is about 10,000 miles. Explain.

Tuning around 14.268 Thursday night (0100 UTC 8-Sept-00), I heard a Morse code ID (which I didn't catch) then an unfamiliar set of tones. I was unable to decode it with any of the modes in MixW32. It wasn't SSTV either. I know that's not mucth to go on, unless you were there.

73,
Mark

> Not to mention the fact that it requires a Sonet *modem* to
> plug that OC3 into some computer.

I can get an OC3 to the linux box - dont worry your pretty little head about how.. you just worry about how you are going to suck that much out of it and put it on the airwaves, cos that is the bit that I dont know how to do, and dont have the time to find out.. I was just pointing out that there is plenty of bandwidth to be had if the hardware existed.

> Cool!
> How ya gonna get that RF network to me?
> Is about 10,000 miles. Explain.

I'll provide bandwidth - thats all.. If you want an RF network spanning 10Kmiles, thats your problem (or the problem of those who said they can do it).. I havent the feintest idea how to do that..

But elaborating a little further, if someone does come up with an setup that will work, Id even put in some work getting people to set up stations in my area and proving the conept.. Get someone clueful enough design/make the gear and Ill provide a place for it to run with enough Internet to soak your keyboard..

scott..

How did Kenwood manage to get a 9k6 modem to fit into such a small space on their TH-D7A radio(not to mention a dual-band radio with two serial ports). Has anybody opened up one of these puppies yet?

The old 1200bps Amateur TNCs have a special modem chip(but most of them are still huge because nobody bothered to upgrade the technology in the last 5 years - save PacComm with the picoPacket). The old 1200bps modem chip has been available for years(since the 80's). I believe it was put out my AMD, and was called the "World Modem Chip" because it did both Bell 202(old European 1200bps telephone standard, and ham packet standard) and Bell 212(old American 1200bps telephone standard).

But the TAPR 9k6 modem has a bunch of discrete stuff, the thing costs $80 for a kit - and the thing is HUGE! Are there now commercially available modem chips(or chipsets) that will do the job for 9k6 packet?

It kind of irks me that TAPR is stumbling around with another huge project that they aren't going to finish(the FHSS radio, like the packetRadio before it). My feeling is that they should have continued to build on past successes, or existing designs - rather than embark on

an outrageously optimistic journey into totally uncharted territory.
The TAPR 9k6 modem works well. Evidentally, it works better than its
predecessor the TAPR K9NG 9k6 modem(I believe it is based on the G3RUH
design, which is superior). However, it is MUCH bigger, and much more
expensive($80 vs. $35) than the old K9NG. Why didn't they just work on
improving this design - getting the cost and size down? Now that
handheld wireless is becoming a reality, and the need for small,
inexpensive and reliable 9k6 modems is upon us again - TAPR is left to
play "follow the leader", when they could have had a 5 year jump on the
industry!

That's just the thing I'm trying to avoid. The local telco has a monopoly and makes everything extremely expensive. I'd also like to get a 24/7 connection instead of a dial-up like ISDN. Staying connected with ISDN 24/7 over such a distance would be more expensive than getting a leased line.

Thanks

With one hop, do you mean 1 repeater? The topology between the points is a bit hilly. The other point is near the coast and so is at sea level. There

```
is about a kilometer (0.65 miles) difference in height between the 2 points.

Isn't there any way of making sure if it's possible to do what I want? I'm
in South Africa. Anyone know someone down here that does this sort of thing?

Thanks

Depends on the geography ... hills in the way?

If there is a clear line of sight path available, then it can be done in one
hop, with some expensive gear, perhaps $1000 per end.

I suspect Gary will post details. This was discussed at length a few
months back.

Well now, if you want "non-low-budget" that's a different story.
Here is a web site that may be of interest.

Mobile Telesystems, Inc. at http://www.mti-usa.com/

They have systems that will handle up to 256 kpbs but the one
that might be of interest to you would be the TT-3080A, in the
"Products" section.

With radio equipment, your hourly/monthly fee to the telco will be replaced by a huge one-time investment followed by possibly lower recurring costs for electricity, maintenance etc. But the break-even point may be quite distant in the future. Calculate it first.

Also, you may be under-estimating the technical difficulty. Radio amateurs have not been able to deploy technology like you need on a wide scale. Sure, it has been designed and it is working, but (comparatively) nobody is using it. That should be a bit of warning.

Meant no repeaters. That antennas at each end could be seen well in
the clear from each other. If they can't, you will need repeaters placed
such that at each hop there is a visual path between the antennas.

I have run across a few hams from S.A. that do digital networking, but
don't think any of them follow this newsgroup right now. Perhaps someone
who does read this can remember who they are ... my mind is blank ...

Earth Curvature, Cost projection Thoughts:

You want a 150 mile radio link. Let's look at some of the engineering problems. Since one station is 1000 metres higher than the other, this means the radio range with Earth curvature is 81 miles.

```
Eq. 1    d = sqrt(17*h)        Distance of the path in kilometres
             Where h = 1000 metres
             Then
             d = 130 km or 81 miles.
```

Thus, 150 miles is out of the question unless you raise the antenna height.

Solving for h, we can re-arrange to:

```
             sqrt(h) = [d / sqrt (17)]
Eq. 2    h = [(241 / 4.1231)]^2
             h = 3417 metres - (1000 metres elev diff) or 7930 ft
```

You could split this between the two sites, and say have two 4000 ft antennas.

Most microwave links are 40 miles (64 kilometres). Plugging this into Equation 2,
we find that the antenna would have to be 791 feet high if both were at sea level,
but since one station is 3280 feet higher than the other, you should be able to use roof-top antennas given no obstructions.

To do what you desire, I would say, you need about 4 hops (the two ends, and two repeaters in-between. You would need about 10 Watts per radio into a microwave dish. 10 Watts in an in-line amp at 2.4 GHz is about $2k to $3k per node, or about $8k to $12k USD.

Using a Spread Spectrum radio like the Proxim 7921, you can expect about 7 miles per hop, or about 21 hops (the two ends, and 19 repeaters). Each repeater costs about $500 (radio, antenna, misc), or about $10k USD. Each repeater has a 30 ms latency, or a path latency of 6.3 seconds (a packet leaving your node would arrive about 6 seconds later at the end-node).

Looking at the above, I'd say that unless you are very wealthy, and have money to blow (.com stock) you would be better off buying a sail boat and a couple cases of beer. It would be infinitely more fun.

Yours Truly,

Jimmy

Hello, I am in need of a factory service manual, or a copy thereof; I
have a 211 that is from 2.5KHz to as high as 19KHz higher than
displayed frequency both TX and RX. When first powered up it is right
on frequency then drifts the amount previously mentioned; however,
once warmed up the drift stops and the unit is stable from there on.

If anyone out there can help it would be most gratefully received,
please reply to sulch@gte.net

Thank you,
73s Chuck KG4ESR

At that distance a VHF/UHF troposcatter link might be possible. Troposcatter links have been used e.g. to provide telephone services to North Sea oil rigs.

At 240 km distances the troposcatter path loss on VHF/UHF is less than 200 dB for about 99 % of the time. These are worldwide averages and the loss can vary from region to region.

Maybe about -110 dBm of received signal is required to transfer 64 kbit/s. Antenna systems with multiple yagis at both sites may have a gain of 20 dB on each site. The antennas must have a clear view of the horizon (0 degree elevation), any local obstacles above 0 degree elevation will increase the path loss by 10 dB for each degree.

With 100 W (+50 dBm) transmitter power, the received power would be +50+20-200+20=-110 dBm or just sufficient for 64 kbit/s. The regional phase loss variations can be large and there can be seasonal variations also, so you may have to be prepared to use 1 kW transmitter power or drop the speed to 9600 bit/s.

Ordinary FSK and PSK will suffer quite a lot distortion from troposcatter propagation and this may require the use of some more robust modulations, such as spread spectrum or COFDM.

If this is not an amateur radio application, then these sites needs to be licensed, requiring frequency allocation and station inspections.

So neither is this a low budget alternative.

You might check for satellite based Internet operators if they provide service in your region. Some require an ordinary phone line for uplink, while at least some plan to have systems in which the user also has a satellite uplink transmitter. However, this may require special licensing arrangements in some countries.

If 9600 baud will be good enough, the no repeater solution
might work. Gear is much cheaper, on the order of $500 - $700
per end including antenna arrays, feedline, power supplies.

In this area the terrain is similar, with long valleys and high mountains.
We have several 9600 baud links that span 65 to 100 miles and
work very well. None at present that span more than 100 miles,
because the terrain prevents such links.

Make Money $$$ Work at home! Easy

EASY MONEY - NOT A SCAM! I found this on a bulletin board and decided to try it

A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to
this that said you could make thousands of dollars within weeks with only an initial investment of $6.00!

So I thought, "Yeah right, this must be a scam." But like most of us, I was curious, so I kept reading.
Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article.
You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it.

So after thinking it over, and talking to a few people first, I thought about trying it.
I figured, "What have I got to lose except 6 stamps and $6.00, right?"

Then I invested the measly $6.00. Well GUESS WHAT!?...
within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon,
but the money just kept coming in. In my first week, I made about $25.00.
By the end of the second week I had made a total of over $1,000.00!
In the third week I had over $10,000.00 and it's still growing.
This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly.
It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!!

Let me tell you how this works and most importantly, WHY it works...
Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it.
I promise you that if you follow the directions exactly, that you will start making more money
than you thought possible by doing something so easy!
Suggestion: Read this entire message carefully! (Print it out or download it.) Follow the simple directions

and watch the money come in! It's easy. It's legal And, your investment is only $6.00 (plus postage)
IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is 99% no risk
- it really works! If all of the following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60
days. This program remains successful because of the honesty and integrity of the participants.
Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order
business. In this business your product is not solid and tangible, it's a service.
You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists.
However, the money made from the mailing lists is secondary to the income which is made from people like you and
asking to be included in that list. Here are the 4 easy steps to success.

STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper
"PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH
of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery).
Next, place one paper in each of the 6 envelopes and seal them.
You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your :
name and address, and a $1.00 bill. What you are doing requesting a legitimate service and you are paying for it!
Like most of us I was a little skeptical and a little worried about the legal aspects of it all.
So I checked it out with the U.S. Post Office : (1-800-725-2161) and they confirmed that it is indeed legal.
Mail the 6 envelopes to the following addresses:

#1) K. Hurls, 3908 Ardmore St, Silver Springs, NV 89429
#2) R. Fowler, 60 Hemlock Haven, Hampton, NH 03842
#3) Sandra Scott 145 E. David Dr. Nashville IL 62263 #5) J. Little 12 Black Oak Ct. Reisterstown, MD21136
#4) GR. Casey, 22 Danelagh, Tamworth, Staffs. B79 8LR. England.
#6) Andreas de Br�cq Oredalen 101. 1612 Fredrikstad. Norway

STEP 2: Now take the #1 name off the list that you see above, move the other names up
(6 becomes 5, 5 becomes 4, etc.) and add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post

your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups)
All you need is 200, but remember, the more you post, the more money you make!
You won't get very much unless you post like crazy. :)

This is perfectly legal! If you have any doubts, refer to Title 18 Sec.1302 & 1341 of the Postal lottery laws.
Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again.

PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants
and by their carefully adhering to the directions. Look at it this way. If you are of integrity,
the program will continue and the money that so many others have received will come your way.

NOTE You may want to retain every name and address sent to you, either on a computer or hard copy and keep the
notes people send you. This VERIFIES that you are truly providing a service.
(Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.)

So, as each post is downloaded and the directions carefully followed, six members will be reimbursed
for their participation as a List Developer with one dollar each. Your name will move up the list geometrically
so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!!
What an opportunity for only $6.00 ($1.00 for each of the first six people listed above)
Send it now, add your own name to the list and you're in business!

DIRECTIONS FOR HOW TO POST TO NEWSGROUPS
Step 1: You do not need to re-type this entire letter to do your own posting.
Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document,
and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory.
Step 2: Open a blank 'notepad' file and place your cursor at the top of the blank page.
From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list.
Step 3: Save your new notepad file as a .txt file. If you want to do your postings in different settings,
you'll always have this file to go back to.
Step 4: Use Netscape or Internet explorer and try searching for various newsgroups
(on-line forums, message boards, chat sites, discussions.)
Step 5 Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting

paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You're done with your first one! Congratulations...THAT'S IT!

All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU HAVE TO POST A MINIMUM OF 200 That's it!

You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the : postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $625.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00! With an original investment of only $6.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again.

The thing to remember is do you realize that thousands of people all over the world are joining the Internet and reading these articles everyday? JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will really work!!!

Make Money $$$ Work at home! Easy

EASY MONEY - NOT A SCAM! I found this on a bulletin board and decided to try it

Step 1: You do not need to re-type this entire letter to do your own posting.
Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document,
and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory.
Step 2: Open a blank 'notepad' file and place your cursor at the top of the blank page.
From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list.
Step 3: Save your new notepad file as a .txt file. If you want to do your postings in different settings,
you'll always have this file to go back to.
Step 4: Use Netscape or Internet explorer and try searching for various newsgroups
(on-line forums, message boards, chat sites, discussions.)
Step 5 Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting
paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings
in a particular group, click the post message button. You're done with your first one! Congratulations...THAT'S IT!

All you have to do is jump to different newsgroups and post away, after you get the hang of it,
it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU HAVE TO POST A MINIMUM OF 200 That's it!

You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box
due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use,
as long as the : postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings,
each with my name at #5 and only 5 persons respond to each of the original 5, that is another
$25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each,
I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200
with my name at #3 and only receive 5 replies each, I will make an additional $625.00!
OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they
each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to
200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00!
With an original investment of only $6.00! AMAZING! When your name is no longer on the list,
you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting
your name at number 6 again. And start posting again.

The thing to remember is do you realize that thousands of people all over the world are joining the Internet
and reading these articles everyday? JUST LIKE YOU are now!!
So, can you afford $6.00 and see if it really works?? I think so... People have said,
"what if the plan is played out and no one sends you the money? So what! What are the chances of that happening
when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday
and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those
joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will really work!!!

Make Money $$$ Work at home! Easy

EASY MONEY - NOT A SCAM! I found this on a bulletin board and decided to try it

A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to
this that said you could make thousands of dollars within weeks with only an initial investment of $6.00!

So I thought, "Yeah right, this must be a scam." But like most of us, I was curious, so I kept reading.
Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article.
You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it.

So after thinking it over, and talking to a few people first, I thought about trying it.
I figured, "What have I got to lose except 6 stamps and $6.00, right?"

Then I invested the measly $6.00. Well GUESS WHAT!?...
within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon,
but the money just kept coming in. In my first week, I made about $25.00.
By the end of the second week I had made a total of over $1,000.00!
In the third week I had over $10,000.00 and it's still growing.
This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly.
It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!!

Let me tell you how this works and most importantly, WHY it works...
Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it.
I promise you that if you follow the directions exactly, that you will start making more money
than you thought possible by doing something so easy!
Suggestion: Read this entire message carefully! (Print it out or download it.) Follow the simple directions
and watch the money come in! It's easy. It's legal And, your investment is only $6.00 (plus postage)
IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is 99% no risk
- it really works! If all of the following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60
days. This program remains successful because of the honesty and integrity of the participants.
Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order
business. In this business your product is not solid and tangible, it's a service.
You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists.

However, the money made from the mailing lists is secondary to the income which is made from people like you and asking to be included in that list. Here are the 4 easy steps to success.

STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery).
Next, place one paper in each of the 6 envelopes and seal them.
You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your : name and address, and a $1.00 bill. What you are doing is requesting a legitimate service and you are paying for it!
Like most of us I was a little skeptical and a little worried about the legal aspects of it all.
So I checked it out with the U.S. Post Office : (1-800-725-2161) and they confirmed that it is indeed legal.
Mail the 6 envelopes to the following addresses:

#1)K. Hurls, 3908 Ardmore St, Silver Springs, NV 89429
#2) R. Fowler, 60 Hemlock Haven, Hampton, NH 03842
#3) Sandra Scott 145 E. David Dr. Nashville IL 62263
#4) J. Little 12 BlackOak Ct. Reisterstown, MD21136
#5)GR. Casey, 22 Danelagh, Tamworth, Staffs. B79 8LR. England.
#6)C. Sovey, 2888 Kinde Rd. Kinde, MI 48445

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc.) and add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups)
All you need is 200, but remember, the more you post, the more money you make!
You won't get very much unless you post like crazy. :)

This is perfectly legal! If you have any doubts, refer to Title 18 Sec.1302 & 1341 of the Postal lottery laws.
Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again.

PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way.

NOTE You may want to retain every name and address sent to you, either on a computer or hard copy and keep the
notes people send you. This VERIFIES that you are truly providing a service.
(Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.)

So, as each post is downloaded and the directions carefully followed, six members will be reimbursed
for their participation as a List Developer with one dollar each. Your name will move up the list geometrically
so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!!
What an opportunity for only $6.00 ($1.00 for each of the first six people listed above)
Send it now, add your own name to the list and you're in business!

DIRECTIONS FOR HOW TO POST TO NEWSGROUPS
Step 1: You do not need to re-type this entire letter to do your own posting.
Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document,
and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory.
Step 2: Open a blank 'notepad' file and place your cursor at the top of the blank page.
From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list.
Step 3: Save your new notepad file as a .txt file. If you want to do your postings in different settings,
you'll always have this file to go back to.
Step 4: Use Netscape or Internet explorer and try searching for various newsgroups
(on-line forums, message boards, chat sites, discussions.)
Step 5 Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting
paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings
in a particular group, click the post message button. You're done with your first one! Congratulations...THAT'S IT!

All you have to do is jump to different newsgroups and post away, after you get the hang of it,
it will take about 30 seconds for each newsgroup!

**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!
BUT YOU HAVE TO POST A MINIMUM OF 200** That's it!

You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box
due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use,
as long as the : postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! I'm happy (you don't know *how* happy) to announce that APRS Protocol Specification Version 1.0 was approved by the APRS Working Group on August 29, 2000 and has been made available for download at the Working Group web page, http://www.tapr.org/tapr/html/Faprswg.html.

This Version 1.0 (technically, due to change control, version 1.0.1) document is nearly 130 pages long and does a tremendous job documenting the APRS protocol as used on the air in the summer of 2000. We should all thank the Working Group members, and especially Ian Wade, G3NRW, the Technical Editor who actually wrote the thing, for their hard work. Although the process took far longer than anyone anticipated when we started, I think the end result is definitely worth the wait.

Where do we go from here? Although this is an excellent document, it almost certainly still contains errors, omissions, and ambiguities. In addition, it reflects only the current protocol, and not any of the areas in which the protocol might be extended. The WG members will be meeting at the DCC in Orlando next month and electronically thereafter to put in place a mechanism to deal with requested corrections and enhancements. The WG Charter outlines a way to handle this, but experience has shown that some modifications may be necessary for a workable process.

Also at the DCC and thereafter, the WG will consider adding new members. Since its founding, several new authors have come on the scene, and two of the original members have resigned. Any author of software or firmware implementing the APRS protocol who wishes to join the WG should contact me (jra@febo.com or n8ur@tapr.org) directly. Please -- we need to hear directly from those interested in joining, so rather than writing to ask that someone be considered, encourage that person to get in touch with me. Also, please remember that the WG is not affiliated with TAPR. Membership decisions will be made by the group, and I can't tell you now how many (if any) new members will be added.

73,
John Ackermann   N8UR
Administrative Chair, APRS Working Group

Have you taken a look at the pinouts at www.packetradio.com?

If you can find one, the kantronics KPC3+ manuals have good info as well.

Describing the BP-1 conductors by the colors if of no use to anyone who may try
to help. Give us their purpose: PTT, audio out, audio in, etc.

I run 2 HTX-202s here, both on KPC3+'s. Work great!

Thanks very much to everyone who replied, especially to J. Hoffa and Paul Keinanen for your long and detailed replies. I won't be able to do what I wanted due to the technical difficulty and cost of such an operation.

As I've mentioned bandwidth down here is really expensive. There is a new service launching early next month that will be providing 2MB links at an unbelievably (for us) affordable price. The only problem is that this new service won't be available in the local town soon. I wanted to hire the service in the closest city and communicate with my equipment in that city.

Just for interest's sake, how much do 2.4GHz repeaters cost? And also, where can these usually be put? Do you hire space from somebody else's tower?

Thanks again everyone.
Sarel Botha

It is becoming more and more clear that you aren't looking for AMATEUR
radio at all. You are in the wrong group.

As amateur radio enthousiasts, we normally are not looking for a cheap
replacement for a leased line, but we are interested in experimenting with
radio. With that motivation and a lot of lobbying, we often get telco
tower space for free.
When you are just after cutting under the telco's own rates, they probably
won't be that considerate.

Rob

All,
Has anybody tried Digipan 1.2 under Win 2000, It can't find my sound card, I was wondering if Win 2000 (aka NT 5) was preventing it talking directly to the hardware? If that is what digiPan does?

Thanks & 73

I ordered the BP2-M today from Tigertronics as an upgrade to my BP-1 which I have had years of success with on Packet.

I noticed as one of the features of the BP2-M is SSTV. I have read over the years about Slow Scan but never felt ready to make the plunge into it.

Has anyone used the BP2-M for SSTV and what kind of results have u had?

Thanks in advance.

At first glance it would appear that the 2W ERP limit for MURS is "crippling".

However, if someone mounted a "moderate" gain antenna at a decent height, through good coax, from a 1W transmitter - he wouldn't be exceeding the ERP limit by very much, if at all, but would have excellent coverage.

On GMRS you can use 5W ERP. But, unfortunately, with GMRS you can't transmit data.

There is obviously much more chance for users to attempt to exceed the ERP limitations(especially if they don't exceed it by much) than there is for them to attempt to skirt the emission type limitations(a "yes or no" proposition - there is no grey area). So, there is no doubt that MURS offers more potential than GMRS, and there is a potential impact to Amateur Technician Class growth.

Now, let's look at digital modes. I think that this is where MURS offers the most potential. The lack of repeaters is actually a benefit for digital modes(as the use of dedicated repeaters for packet are extremely rare). Also, there is a renewed chance to try to build a 9600bps network on VHF. In the 80's, there was massive growth of the 1200bps Amateur packet network. There actually was a time when Hams were using 1200bps, when most telephone modem users were at 300bps. But the 1200bps standard soon became an anchor around the neck of Amateur packet radio. In the 90's, as telephone modem users saw their communications rates climb to 2400, 4800, 9600, 14.4, 28.8, and then to 56kbps - the hams were STILL slugging along at 1200bps. In 1990 2400bps packet was easily achievable, but everyone had standardized on 1200bps - besides, everyone felt that 9600bps was just around the corner. However, by this time, the majority of hams had become "appliance operators", and were not capable of the effort that was needed to build a non "plug-and-play" system(which 9600bps systems generally were at the time). This was not helped by the major radio manufacturers, who had a difficult time producing a true 9600bps-capable radio. Today, however, the story is changing. It is much easier to build a 9600-bps capable station.

I wonder if the 9600bps-capable Kenwood TH-D7A(with builtin TNC) can be modified to operate on the MURS channels(150Mhz)?

BTW, with the 2W ERP limitation, and no repeaters, the 5 channel limitation also sounds worse than it actually is. Besides, very few people are using any the Amateur 2m channels, at least here in Southern California. There are a few busy repeaters, but that is it. The rest of the channels are "dedicated" to silent, unused repeaters. Albiet, there is one channel dedicated to 1200bps 2m APRS use that is well utilized; but the few other channels where packet activity is seen, are just filled by hi-level nodes incessantly "blabbering" to each other at 1200bps - filling the channel bandwidth, while not performing any useful function. At least at 9600bps, it is possible to use TCP/IP, and get away from THAT nonsense.

Why would a technically capable person opt for 5 discrete CHANNELS and a limitation of 2W under MURS, when the Technician license allows 1500W and literally hundreds of available MEGAHERTZ of to build out their data, voice, or image network? Your notion of "potential impact" to Amateur Radio disappears under the simplest reality-check.

> I wonder if the 9600bps-capable Kenwood TH-D7A(with builtin

The modification would be easy, but it would be illegal to use on MURS.

Because they wouldn't be hamstrung by the Amateur limiations on
performing business, or freely accessing the Internet. Those are HUGE
advantages.

There are quite a few of the digitally-oriented hams out there that
take the position that most ANY ham Internet access is "verboten",
because it is so commercialized.

I'm sure it will be a slam-dunk for Kenwood to produce a MURS-specific
TH-D7A, and get it FCC type accepted. Radio Shack and Motorola won't
be far behind.

2400 Baud for telephone modems was in place well before 1990.

> and get away from THAT nonsense.

What "5 channel limitation?" The DX-cluster channels are also quite active, and if 9600 baud were really in use, the ONE frequency that is allocated to it would not be idle 99% of the time. Also, the net/rom node interchanges are less than 50% of the traffic on the bands - there are BBS users and other things happening too.

If you want to justify a spectrum grab on 2m for digital, the existing digital allocations had better be utilized at more than "full capacity" (meaning that INTERACTIVE stations [as in a real person is there] have problems communicating because of collisions with other interactive stations passing traffic 80%+ of the time).

Consider also that there are several frequencies in the other bands (notably 70cm and 23cm; maybe 6m) which aren't reserved for specific uses yet.

```

The price of these FRS radios is what draws many to them.

The fact that they are better than the 6 meter and 11 meter old days talkies gives them added value.

But once you've seen power and antennas, those products seem silly to use outside their intended market.

Buy one, they are fun, and are great for families with kids, for vacations, and many other uses. Using them outside their design market is both illegal, and without technical merit.

Jimmy

You make the assumption that the idiot making the original post is (or
even could recognize) "a technically capable person."

If you don't like it - cry to the FCC.  I doubt if you'll have any luck
going up against Radio Shack and Motorola.  As for me - I'm looking at
ways to take advantage of it.

Hey good buddy!
Stick an afterburner on it, and put up one of them big skysweeper things!
That will take care of the 2W ERP limit!

MURS is a giggle ... kinda like them there Rat Shack handies.

I thought you were talking about the amateur channels on 2m - as 145.01-.09 - 5 consecutive digital channels. Mentioning how "quiet" the amateur allocation is threw me ... and if it is so quiet where you are, then why do you need to get away from it all by using another [proposed] service?

When one writes a paragraph, a reader usually expects the text to follow a logical flow and not be a non-sequitur.

MURS is not a reality until it is actually enacted. For now, it's just a proposal.

Then, what was your purpose in discussing inactivity on the 2m amateur band?

1) Why do I need to cry to the FCC about an underutilized allocation that IS available to me? I would simply use it if I had a need.

2) Why do I need to justify the design and sale of equipment destined for use on a set of frequencies that had no legal or licensed users? Their design and sale irregularities are their problem, not mine.

I have the same problem.

Does any one know?

Hi all.

You may or not be aware that I carry most current psk etc softwares on the download page of my site, and the following software's have been updated.

Logger by Bob K4CY is now in version 7.09

Zakanaka is a special case as it is in Beta testing format, and now upto Beta 16.

MixW32 by Nick UT2UZ is now in version 1.43 (Registered, and Demo)

Apart from the Beta16, the above are on my download page.

http://www.btinternet.com/~g3vfp/download.html

Best Regards,

Dave G3VFP

Hello,

As a user of the HOKA Code 3 Gold software I was recently looking for the mailing list that was hosted at grove.net.

As it seems that this is no longer around (my findings - I may be wrong!) I decided to dedicate some space on my web server to a Hoka Code 3 Forum.

If anybody would like to contribute to this forum it is located at:

http://www.oseu.co.uk/cgi-bin/Ultimate.cgi

This is the forums temporary location until I upload the new web pages. All registered users will be informed of the new URL once the work has been carried out.

Apologies for the cross posting, but I have only posted to the news-groups
that I think would have some interest in the Hoka Decoder.

Regards

Richard Clafton

I am using an older laptop for my portable digital work.I would like to
receive internet email when away
from home with it. I use a kam plus on pactor and the laptop wont run
windows 95 so am stuck with ver 3.11.
Is there a version of airmail or winlink or any other software that may
receive internet email via pactor ?
Thanks to all who read this.

Trying to do something with radios that don't exist, licensed into
a service that does not yet exist, to avoid using Ham Radio ...
... cross-posted to three groups ... it's a troll certainly.

> The cell phone networks don't seem to have a problem.

With what?
```

Your theory is incorrect.

We have a cell-based packet radio network
here, with overlaid small / medium / large cell sizes.

You used to have such a thing in Southern California.
Isn't it there anymore?

Q: Did you know there was Ham frequency allocations above 450 MHz?
Q: What amateur frequency allocations do you see as unnecessary, or wasted?

Eucalypt Software - Makers of Autopost & Rocketfuel --- Ripped Me Off!!!

-

All potential buyers should be warned to steer clear of this company. They have a repeated pattern of ripping people off and ignoring requests for support.

-

I know someone who sent in the $10 registration fee for Autopost TWICE (thinking the first one may have gotten lost) and in both instances, never got a registered version of the program and all of his emails were completely ignored.

-

I myself purchased Rocketfuel on-line and had to pull teeth to get an unlock code. The web site was very quick to take my money, but no registration/unlock code came for days and days. I repeatedly emailed them, only to receive nothing but autoresponses. After 5 days I sent them a message stating that if I did not have a working version of the program by the close of business that day, that I would challenge the credit card charge. Magically, the code arrived several hours later.

-

What kind of way to do business is that?

-

In any case, its academic... there are other products available for free that do virtually the same thing and I only wish that I had known about them before I wasted my time with Eucalypt Software.

-

If your in need of automatic news posting software, there is nothing better than "NNTP Power Post 2000". It's graciously been made available free from the following web site:

-

http://net-toys.8k.com/

-

Save your money... your time... and the aggravation!

-

Peace,

-

PPN

-

-

PS: I have no affiliation with the makers of PowerPost 2000.

N7GSU QSLs offers custom designed, full-color QSLs for $30. These may include photos or artwork, single and double-sided - all $30! Our ever expanding stock designs, personalized with your information are just $15. These include many club designs. Does your club need a custom designed logo, club QSL or it's own award certificates, we do 'em!

Check us out at http://www.n7gsu.com

73,

Robin Faulkner, N7GSU QSLs

Hi Peter.

Here are some for your list. I can't remember where I downloaded some of these.. I found them while doing long searches on the net.. :-)

GNASP1 - Experimental DSP based Audio Signal Processor
(Gerd Niephaus e-mail: gniephaus@cityweb.de)

SbFFT version 1.2, a program for spectral display and filtering using Sound Blaster audio cards. COPYRIGHTED FREEWARE.
(Kevin KW5Q at kevinm@mail.eden.com)

DSPFL111 - JE3HHT - http://members.tripod.co.jp/JE3HHT/dsp/dspfl111.exe
(no English documentation - yet??)

The fact that the interference occurs on discrete frequencies (Prime and
regular harmonics) leads me to believe that it is the monitor. Try changing
the refresh rate and you may verify this. I had the same problem and this was
the cure.

I have been using my DR-135 for several days and it works OK except
that on the AM 118-135MHZ Aviation Band I receive a shortwave station
thoughout the entire band that is operating on the IF frequency of
21.7MHZ. Can you check your radio to see if you have the same problem?

Thanks,
Boykin, KD4AJJ

Ok, this sounds just like my situation... Here's what I've found:

P-III 667, Asus motherboard. The chassis is all metal, but it doesn't matter if the side panels are on or off! The noise is very broad band, but does peak frequently across the bands. It tapers off above 15 meters, but I can hear it even up into the VHF range.

It's not the monitor, and it's not the motherboard, CPU, video, sound, etc. cards. It's the power supply!

I confirmed this by plugging the computer into a different circuit in the house via an extension cord. Lower noise. Then I got a couple of line RFI filters (not surge supressors - they're for a different problem), and that helped more, but going from S7 to S5 still leaves me with an S4 size problem.

The previous computer was an old P90 system from HP, which was totally quiet. I also have a P200 clone in the same room (same wall plug too), and it's pretty quiet too, so it's not impossible to do this right.

It looks like I need to get a new power supply. ATX format, 250 watts. The current unit is from Transworld. Any suggestions for a good QUIET brand?

Greg.

Very good thought about the monitor. Another thing you might want to check out is the susceptibility of the antenna input. I have a Pentium II-233 laptop kissed right up to my old TS-140S. If there are any loose or less-than-perfect connections through the tuner, SWR bridge, coax jumpers, etc., the receiver just roars. If all the connections are made up correctly, it's quiet. I'm assuming you're not using something like an indoor antenna, or a very low, close antenna or an open feedline into the shack. If the antenna is far enough away not to pick up a majority of the noise, the rest of the system should be able to keep it out. You might also try some ferrite on the outside of the coax in various places to prevent noise currents from working their way to the antenna itself.

Some thoughts...

I had terrible power supply noise here; 80m was completely unusable.
The thing even whined audibly when switched off (stand by really).
I replaced it with another one from the clone shop and it's been fine.
Just lucky I guess. The new one seems to have variable fan speed,
which is an added bonus.

Hi,

I am exploring the application of a point to point radio link between two host computers for an academic project.   Ultimately, I would like to write a Window NDIS driver to interface to a an RF modem via a RS-232C connection.

Does anyone have any experience in this area? Any suggestions as to whether its technically feasbile or not? Ultimately, for this acedemic project, I would like to take an existing UDP/IP application an run it over this radio link.

Any advice would be greatly helpful. I have look at a pair of RF modules by a Abacom and it seems to be feasible.

How about Amateur packet radio? From what I have read, it looks like with packet radio, you use a TNC to bridge the host computer and the radio. Is it possible to interface a VHF/UHF transceiver to a standard modem and write the NDIS driver on top of that? My understanding is that the standard analog modem would handle the digital RS232 interface and accompanying digital serial data and modulate it onto a typical carrier signal for transmission over POTS. Could you take that signal and route it to a VHF/UHF transceiver for transmission?   If that even possible or is that just plain crazy?

Are there any other valid, feasible solutions? The ultimate goal of the project is to write the driver and hence the data link layer (handling all the error detection, flow control, etc) and ultimate provide solution to run this particular UDP/IP application over top of it.

As for data rates, I have read about numerous RF modems that claim they can achieve over the data rates of 38.4Kbps (in theory anyway) using GMSK and DFM. Any recommendations on hardware?

Do I still TNC if I am writing the NDIS driver?

Thanks in advance!!

IP via amateur radio links first occurred during the 1980's.

Take a look at:

http://www.raag.org/sv2agw/

He has an NDIS driver, and many other solutions. The TCP/IP over radio
part does have a charge, but it is less than a 6-pack of beer.

Also look at Linux and built-in IP and AX.25.

The AGWPE (packet engine) is also really neat for programming packet
radio solutions using IP and sockets.

Very powerful Windows interface, and similar to the one included
with Linux.

Has anyone used the MFJ 1278B/DSP multi-mode controller? I'm considering buying it, but would like to hear any users feedback, good or bad, before I decide.

I'm using an old PK-232 right now, but it's fading fast. I'm also thinking about the KAM-98 and the Timewave PK232/DSP.

Any input or comparisons on these units is appreciated!!

Thanks

Dave

Hi
I've decided to get back on the air on RTTY, and dug out my old ST5MC.
Unfortunately I don't have the connecting cables anymore. Does anybody
have either a circuit diagram, or at least the pin outs for the DIN
connectors on the back?

Hi all.

there are an ever growing number of interesting softwares about for PSK,
STREAM, RTTY etc. MMTTY by JE3HHT is a superb software with various baud

rates, shift options etc etc, is typical of some free stuff around.

Take a look at the list on my download page, and see if there's anything of interest.

http://www.btinternet.com/~g3vfp/download.html

Cheers,

Dave G3VFP

Hi, I have been using one for a few years now and no major complaints.

Mostly use sound card RTTY and PSK31 now but the MFJ does quite nice on Pactor. Just wish I could send small binary files using it on WinLink2000. (Would be nice to send small .jpg files).

I hope this helps,

Dale

Hi, I have a macro just for that reason.

When ever I get a call back and it does not have the calling station
at least 2 times I push the button:
QRZ <CALL>?? DE MYCALL

If I got some copy it will print with the <CALL> tag. (MixW software)

Hope this helps,

Dale

I have a PK-232MBX. In moving the station from one place to another, I lost the cable (or don't know which one is which, in any event).

The documentation with it advises NOT to use a standard RS-232 cable, but use the one that is supplied with the PK-232MBX.

Now, I know AEA is out of business.

Is there a place I can pick up the special cable that came with the PK-232MBX?

Or is it possible to use a "standard cable" but cut some of the pins?

Thanks for your help in advance
Greg

Hello Greg,

If you are using a 25 to 25 cable, opnly 1 thru 8 and 20 should be connected.
If you are using a 25 to 9 cable, here are the connections:

RS232	9-Pin DIN
8	1
3	2
2	3
20	4
7	5
6	6

```
4...................7
5...................8
1................... No connection

http://www.timewave.com has complete details on repairs and upgrades, as well
as softwrae for the PK-232.

Anyone have BP-1 to HTX202 tips? I have tried to connect my Baypac BP-1 to my
HTX202 and Yaesu 530 but several attempts have failed to get it to transmit (
the screen says it is transmitting, radio is not) I had no trouble getting it
to transmit on the HTX212. I am using the pin out that Baypac suggests in its
"hints" folder included in its software.   (Yellow to mic center pin, red not
attached) Speaker pinout is Green is center, balck is side.

Any one know what else might work???

Sean

I used a standard cable and broke off the pins. The manual tells you which one's should not be connected. If you don't have a manual, I could look it up for you.

Anyone know if the Icom CI-V protocol allows for setting TX and RX (ptt), especially in the older versions of the protocol (apparently 0x17 does this for the very latest rigs only).

None of my docs imply this can be done.

If so, what is the CMD, SUBCMD, etc.?

64 kb/s, low-budget, and 150 miles are conflicting requirements.

>Ethernet style CSMA will not work reliably with such distances and
>high speeds. In order to work reliably, omnidirectional antennas would

>have to be used and in order to get the required ERP, quite high transmitter powers would be required. My guess is that the 56 kbit/s receiver will require about -110 dBm of receiver power. Looking at some old troposcatter diagrams (The Radio Amateur's VHF manual, 1972), the path loss for 50 km and 99 % reliability is about 160 - 170 dB. Thus, a transmitter power of +50 .. +60 dBm (100 W .. 1 kW) is required.

The WA4DSY RF modem requires a signal strength of about -110 dBm to maintain a 1 in 1E6 bit error rate. But that's the signal strength at the modem's 29 MHz input. The transverter ahead of it may have gain, as may the antenna, so the off air field strength may be considerably lower. (Typically with our setups about -140 dBm is the point where bit errors exceed 1 in 1E6.)

We run a pair of 56 kb stations over a 70 mile path. The stations run about 4 watts transmit power, as do all of our sites. It is a mountain top to mountain top LOS path, though, and we use a long boomer gain antenna at one end. The path is very reliable. But we have another path that is only 18 miles, but obstructed, that has periods of high errors, correlating with the formation of an inversion layer over the area on summer evenings. One site is above the layer, the other is below it.

We run much longer frames than that (that limit is forced by some TNCs,
but we don't use TNCs, and set frame lengths of between 1k and 4k bits),
and run a large maxframe too, but you're right that latency becomes a very
serious problem as multiple hops are traversed in a simplex digipeating
environment.

We do that, using 222 MHz and 440 MHz. You need two transverters,
and usually two antennas too, so it isn't a really popular approach for
users. It is worthwhile for node to node links though.

We do that too, on 440 MHz. It is more popular with our users since the
equipment required at their stations is simpler, ie only one transverter
and antenna.

Or just run pure Aloha and tolerate the collisions. The latter works ok,
expecially if you implement a random exponential back-off algorithm,
if the frequency is not very congested. You will eventually get congestive
collapse (or just as bad, back-off to practical infinity) if too many stations
are on, though.

We have done some mobile work (digital voice), and the multipath
problems aren't horrible, even on 222 MHz, until you stop. As you
say, you always seem to stop in the null. Of course digital voice
is quite tolerant of bit errors, unlike data transmissions.

Hi all, next Saturday (Aug 12,00) KF4SIR (QTH Orlando) will be running
a relay experiment to see if PSK31 can be used to send e-mail
messages.

Will be running contest style auto CQ on 14090Mz + 1500Hz starting at
8:00AM EST until 11:00 AM EST. Will try and run second session from
8:00 PM until 11:00 PM EST. Will also be trying QPSK for the last hour
in the first session and the first hour in the second session.

UTC times and more information available at:
http://psk31relay.net

Please stop by if you can and be part of this interesting experiment.
Will only need to copy one short message - should take less then 1
minute.

Thanks, Dale

I am not "seasoned" with packet radio or the soldering iron but wonder if
the following can be done with simplicity:

Dad (newly licensed) goes RVing across the US from time to time. Can he use
packet radio connected with a palm pilot to send messages from varying
locations to my email address? (His location changes every 1 - 3 days and it
would be nice to keep in touch and know where he is.)

Is there a way that I could email (I'm not set up on packet yet) messages
back to him that could be held at a BBS where he could pick them up via

packet? Could he somehow connect by packet to the same BBS to receive any messages?

For this to work it needs to be kept relatively simple. If it became complicated Dad probably wouldn't want to be bothered by it.

I hope that this is being done already. Wouldn't it be wonderful to be on the road, pull into a place, fire up the radio and send off a quick packet message that you have arrived safe, how your day went, and where you expect to be tomorrow. Then with a minimum of packet commands receive any messages from home.

If you can give me direction or advice in this regard I would greatly appreciate it.

Thanks in advance,

David Bell (KC7CNA)

there was an article on how to do this in either QST or CQ within the last year. Some one could search the indexes for the article. It dealt with using a palm pilot and a TNC with a mobile radio.

I will look to see if I can find the article.

Are you sure about your sensitivity measurements ?

After all, we are talking about terrestrial links and you will have the warm earth in the receiver antenna lower sidelobe, so maybe a 300 K antenna temperature is a reasonable quesstimate for VHF/UHF. This corresponds to -174 dBm/Hz noise density and with a bandwidth of larger than 10 kHz, the noise power would be stronger than -134 dBm and you need some positive SNR, so the signal has to be in the -120 .. 130 dBm range even with noiseless front end. Even if you have 30 dB of transverter gain ahead of your 29 MHz system, I do not think you can get much better sensitivity than the -110 dBm level.

Of course, things get different if you are receiving the data from a high orbit satellite in the microwave band, when you can have the system noise temperature below 300 K.

IIRC "Microwave mobile communications" by Jakes even derives a formula
for the probability of stopping at the null :-).

While this old book (1974) is severely outdated when talking about
communication systems, the UHF/microwave non-LOS propagation part is
very interesting even today.

SPOKENWORLD NEWS
****
- It's Nationals time and you're going to hear it on Spokenworld.com. Four days of live slam from AS220 in Providence, RI! Here's the schedule as it stands now for the teams you'll hear live!

WEDNESDAY AUGUST 9TH
8:00-9:30pm Eastern Time Slot
1 Ann Arbor, MI
2 Roanoke, VA
3 Hot Springs, AR
4 St. Louis, MO
9:30-11:00pm Eastern Time Slot
1 New Jersey
2 NYC-Nuyorican
3 Memphis, TN
4 Mesa, AZ

THURSDAY AUGUST 10TH
8:00-9:30pm Eastern Time Slot
1 Minneapolis, MN
2 Albuquerque, NM
3 West Palm Beach, FL
4 LA CA
9:30-11:00pm Eastern Time Slot

1 Cleveland, OH
2 Worcester, MA
3 Chicago-Green Mill
4 San Jose, CA

FRIDAY AUGUST 11TH (All times Eastern)

What: TEAM SEMI-FINALS COMPETITIONS
When: Bout 1: 8:00-9:30pm
Bout 2: 9:30-11:00pm

SATURDAY AUGUST 12TH (All Times Eastern)

What: FINALS
When: 8:00-11:00pm

Hear them all from one link:
http://audio.netradiolive.com:554/ramgen/encoder/spokenworld/slam.rm
This broadcast utilizes the broadcast technologies and systems of SpokenWorld.com in conjunction with NetRadioLive.com, the webcaster's best friend. Use or reproduction of this broadcast without expressed written consent from Poetry Slam Inc. and Projective Verse is strictly prohibited.

POST GAME SHOW

As always, hear the Spokenworld show hosted by Bob Nelson from 11p-12a (Arizona Time- that's real late for the Easterners!) for call in play by play of the days events and hopefully interviews with the comprtitors! Hear Bob at this link:
http://audio.teralynx.net:554/ramgen/encoder/inkwell/speaking.rm
Chat live with Bob on AOL Instant Messenger using the handle "Spokenworld" during the show!

IMPORTANT WEBSITES THIS WEEK:

The Official National's website: http://www.npsy2k.com
The Official Poetry Slam inc. Website: http://www.poetryslam.com
The Official National's Page on Spokenworld.com:
http://www.spokenworld.com/Performers/2knationals.htm

THERE REALLY IS OTHER NEWS

- UNDER THE BAOBAB TREE WITH SHANTA & LAJADJIE - It's coming, the new and exciting Storytelling Show for Spokenworld.com. New on Sundays. More details to follow!

- July Website Stats. According to Superstats, the site saw 453 Page Views for the month, up from 234 in June! While this is great, the webtrends report due later this month will tell the real story.

- Send your opinions and thoughts to Bob@spokenworld.com .

- As always, feel free to send us your material and let's see if we can get it on the air. Comedy, performance poetry, storytelling, whatever. If it's spoken word, we'll at least listen to it. email, yeah, you got it, bob@spokenworld.com for more details.

- Join the Spokenworld2U list. talk to others that enjoy spoken word as much as you do. email list@spokenworld.com and type in the body of your message: subscribe spokenworld2u "your name". That's it!

WHAT IS THIS NATIONALS THING GONNA SOUND LIKE?

Listen to the links below to the 2000 Essenzaslam Championships held in Mesa, AZ. Multiply this times a factor of, say 1000, and you'll get pretty close:

Round 1, part 1:
http://audio.netradiolive.com:8080/ramgen/inkwell/slamoff1.rm
Round 1, part 2:
http://audio.netradiolive.com:8080/ramgen/inkwell/slamoff_1_1.rm
Round 1, part 3:
http://audio.netradiolive.com:8080/ramgen/inkwell/slamoff_1_2.rm
Round 2: http://audio.netradiolive.com:8080/ramgen/inkwell/slamoff2.rm
Round 3: http://audio.netradiolive.com:8080/ramgen/inkwell/slamoff3.rm

****

RADIANT READINGS

****

The August 10th show will be Langston Hughes
Here's the stream link:
http://audio.teralynx.net:554/ramgen/encoder/inkwell/readings.rm

Radiant Readings, hosted by Sharon Skinner
Thursdays at 8p-9p PDT
Archived Shows available at the Radio Show Website

Sharon Skinner reads the work of both Classic and Contemporary Authors, providing insight and discussion into their work. Last week was Anne Sexton and that show is available for listening to at the SpokenWorld.com website (http://audio.netradiolive.com:8080/ramgen/inkwell/Radiant/radiant10.rm). Here's the link to the show's home page to listen to the many other archived shows:
(http://www.spokenworld.com/radio_show.htm#Radiantreadings).

Stafford County Virginia (Northern Virginia)

The Stafford Amateur Radio Association (SARA) will be holding
their October HAMfest.

When: Saturday Oct 14
Where: Mt. Ararat Baptist Church Parking Lot

Directions: From I-95 go west on Garrisonville Rd (Rt 610) for approx 4
miles
and turn North on Toluca Rd (Rt 657)

Talk-In on 145.27 MHz

Free Admission to all
Tailgaters: $5.00 per space - $4.00 if reserved prior to Oct 1.
Free demo of Stafford County's Emergency Communications Bus
Free Radio Equipment testing.

Directions/ Details at SARA website http://www.n4nw.org
E-mail: RLDiddams@earthlink.net

I'm at the stage of having a kernel (2.2.16) with soundmodem support compiled into it booting without any error messages.   I installed the ax25-utils and I can bring up the soundmodem using ifconfig.   When I run smdiag I can actually see whatever I input on the mic-in line of my soundcard (ESS Audiodrive), so it seems like it's working.   How can I test if the modem is working correctly, first the transmitting and then the receiving?   I have an oscilloscope and signal generator I can use if necessary.   Can I just connect the earphone output to the oscilloscope, run a terminal program that outputs to the ax25 port (how do I do that?) and see if it does something on the scope?   Can I then onnect the output to the input directly and see if I receive what I send?
Please email me derictly if possible, I will then try and put something usefull in the way of a tutorial together to maybe add to the AX25-howto.
Thanks

Modules for DECT, RF and OEM

DECT Hardware Modules

Several companies are now supplying DECT OEM modules, in some cases RF only and in others full RF and baseband modules for OEM products - handsets, basestations and other applications. Amongst these are the companies listed below. If you know of others, please advise us.
DECT protocol software modules may be found on the Protocol Software page.

Several companies also offer design services with licensing of designs - see our Design Solutions Page

Applications of DECT Modules
As well as telephones, DECT modules can be used to connect wirelessly a range of other information processing devices, such as a palmtop computer, enabling exchange of data, such as up-to-date schedules, calendars, and databases. Combined with telemetry or telematic systems, DECT systems can be used for the remote control of alarm and security systems for appliances such as washing machines or cookers.   In the commercial environment DECT modules can be integrated into existing equipment or systems - for example enabling customers in a restaurant to pay for their meals with a credit card online at the table.

ALPS
Company website
ALPS produce RF modules, which are sold along with software from S3)

Digades Ltd
Company website
DFM250 basestation module
Download product Data in pdf
Download product Handbook in pdf

DFM251DECT module
The DFM 251DECT is a further development of the DFM 250DECT which offers greatly decreased size (PCMCIA cards are also possible), lower energy

consumption, the development of telephony functions in accordance with the GAP standard and the execution of high-speed data transmission. DECT time slots, in which data is transmitted, can be bundled, allowing a gross data rate of up to 192 kBit/s to be achieved. The module allows simultaneous transmission of data as well as voice. Up to six portable modules can communicate parallel with a basis module

Fraunhofer IIS
Company website
The DECT M2 radio modem - click for a picture
The M2 module allows wireless data communication between a basestation and one or more mobile stations in accordance with the ETSI DECT standard. The module is connected by a 16 pole connector and uses a serial interface communicating with simple AT-commands and data transmission rates up to 57,6 Kbit/s, with TRS/CTS hardware handshake and support of modem signals (DTR, DSR, DCD, RING). An identical module can be used for base and mobile stations for integration into a terminal device. Custom-made solutions can be offered

Size: 80 x 60 x 12 mm
Operating voltage: 3.4 V - 4.7 V (tolerant of up to 5V)
Data interface: TTL compatible data and handshake signals.
Transmission rates: Net data transmission rates, with FEC, up to 24 kb/s
Up to 5 mobile parts may be registered to one basestation by over-the-air transmission or by data interface
Integrated antenna
Range: approx. 40 m indoors, approx. 300 m in free field
Approvals: DECT TBR 6 EMC standard for DECT equipment

The DECT M3 radio modem - click for a picture
The M3 module - an update of the M2 module, supporting simultaneous voice & data.
Preliminary data:
    Configuration as a base station or mobile station possible
    Direct connection to loudspeaker and microphone
    Operating voltage 3.6 V +/- 5%; 3 Ni-Cd cells operating possible
    Serial V.24 interface with baud rates of up to 115.2 kbit/s, with RTS/CTS hardware-flow-control and support of modem signals (DTR, DSR, DCD, RING)
    Coverage area: up to approx. 40 m indoor, up to approx. 350 m in line-of-sight.
    Integrated antennas ~
Download information

The DECT M4 radio modem - coming 2Q2000
The M4 module - a variant of the M3 module -10/+50 Celsius.

B3 Basestation Platform
The DECT basestation B3 is the third generation of the DECT radio module developed by the Fraunhofer Project Group for Wireless Telecommunication and Multimedia Technology. According to the network specifications, different DECT data service profiles can be offered and implemented.

The B3 provides:
* two serial V24 communication interfaces, up to 115.2 kb/s
* one LAN interface -10-base-T, IEE802.11 compliant

The B3 is based on a 16 bit RISC controller and an OEM RF-part.
The RF-part supports antenna diversity and can maintain up to five DECT connections simultaneously.

Core 51 Radio Module

[Ed - No longer included on Fraunhofer website]

This radio module allows digital data communication between a base station and one or more mobile stations using DECT standard and comprsies an 8-bit microcontroller and OEM-RF-part

Size: 80 x 52 mm, height: approx. 18 mm
Operating voltage: 3.45 V or 5 V operating voltage
Serial interface with FIFO, RTS/CTS Handshake
Data transmission rates settable up to 57,6 kbit/s
DECT-standard: frequency- and time-division- multiplex
Frequency band 1,88-1,90 GHz
Range: approx. 40 m indoors, approx. 300 m in free field
Serial interface for data transmission (CMOS voltage level) processor interface
Antenna port (base station also feasible with antenna diversity)

Fraunhofer also offer customised soft- or hardware such as interfaces, outline, and support conformance tests to CTR6 standards for large-scale operation.

Hoeft & Wessel

Company website

Hoeft & Wessel is a company whose main business lines are the development, production and distribution of hard- and software with a specialisation on complete system solutions with developments mainly centred on devices for Mobile data acquisition, Electronic payment, Ticketing, Telematics & Parking.   In recent years they have introduced a range of products using DECT technology and are now offering DECT modules to other companies wishing to use the technology.

HW 86045 DECT transceiver module - Picture

Easy to integrate, Small footprint, Wireless circuit data , Supports point-to-multipoint

HW 86096 DECT transceiver module - Picture

High-speed wireless data transmission , General I/O interfaces , Prepared for voice services , Hub for point-to-multipoint

HW 86010 DECT transceiver module - Picture

Highest integration, smallest footprint , Versatile interfaces for voice and data , Full network support , Prepared for voice service

Inventel

Company website

INVENTEL is a French based design house and manufacturer of radiocommunication products who have developed a range of DECT phones for residential applications, as well as a DECT GAP module, the MDG601.

The MDG601 is available in different software versions:
- wireless serial link with the S3 software
- full GAP module for voice application
- voice and data for mixed application

MDG601 summary - Download the full details
Interfaces - RS232, TTL 3 V
Operating voltage - 3.3 V
Approvals to TBR 6, TBR 10 and TBR 22
External dimensions: 48 x 35.5 x 8.5 mm
Temperature range: +0�C / +40�C
Integrated antenna

IZT - Innovationszentrum fur Telekommunikationstechnik GmbH
Company website
IZT is the industrial exploitation route for DECT M2 module product developed by the Fraunhofer IIS, see above.

RTX Telecom
Company website
Discontinued - RTX1921/22 DECT radio transceiver modules - see the item on the News Page
The RTX1921 and RTX1922 are DECT radio transceiver modules intended for use in low-power, portable terminal and basestation applications. They are compliant with ETS 175-2 and CTR6, as well as the Generic Access Profile (GAP) specifications. Type approval testing reports can be provided upon request. The RTX1921 is intended for use in a portable part (handset), and the RTX1922 with its diversity antenna feature, is intended for application in a fixed part (basestation).

Click for the pdf data sheet

Samsung
Samsung offers two DECT RF module products:
* RU1890H10KRA for use in handset products
* RU1890B10KRA for use in basestation products
These are based around Infineon (Siemens) chipsets

Siemens
MD32 DECT Engine
The Siemens MD32 DECT Engine was first shown at CeBIT99. It promises to be both high quality and good value, given Siemens dominant position in the DECT marketplace, which should offer them good scale economies. At CeBIT99 Siemens showed an application of the module in a palmtop computer.

The size of the MD32 DECT Engine is 65x37x5 mm and it can be used for transmission of voice and data, with a 4-pin audio interface and RS232 serial port. All the data transport aspects are handled by the module, transported using the U-plane LU10 data service, guaranteeing a BER of 10-8.

Find details, including brochures, on the Siemens DECT Engine website or their alternative site

Gigaset DECT "Simcard" - World's Smallest DECT Engine
The new Siemens DECT engine is taking DECT into territory until now claimed by Bluetooth, in terms of form factor.
Size 24 x 14 x 3.5 mm = 1.2 cc, one third the volume of its predecessor, the "Stamp" (see below).
The new product is likely to be a hot topic when it goes on public display at this year's event, CeBIT 2000. Clearly at this size the potential for integrating DECT short range links into PDAs, mobile phones, etc takes a big leap forward.
Download the new Siemens Gigaset Simcard brochure

You can also download from here a Siemens DECT PowerPoint presentation (zipped, but still big !) given at last year's Bluetooth Developers' Conference

Gigaset DECT "Stamp"
Engine for cellular phones, PDAs, etc
Shown at CeBIT '99
Size 24 x 27 x 5.5 mm = 3.6cc
RS232 interface
0 dBm transmit power

The simplest is to just connect it to the transceiver and connect someone.
When it doesn't work, you can always try to find out where it is failing.

Hi Folks!
I have here some trouble with an KAM Allmode Controller.
The KAM with it�s original Firmware 2.85 works fine, an Update
with v6.1 (for the KAM without Enhancement Board) produces a
RAM error in Test mode.

After an Hard-Reset (Jumper K6) this Data appers on my Terminal

```
EEPROM INIT OK          <= changed to 24c16
CHECKSUM OK        <= the Eprom, i guess
RAM ERROR     <= ?
32K RAM            <= RAM size (correct!)
```

After changing the RAM, the same failure comes up, the Adress- and
Data connections on the Printed Board seems also ok.

Changing to v2.85 let the KAM work fine, but i need the
PACTOR Mode from the v6.1.

Had anyone the same error on his KAM and a solution to solve
the Problem?

We have had numerous requests for the manual supplement for the new DSP-599zx firmware upgrade (Version 5.0).
The supplement is now available at:
http:\\www.timewave.com/DSP599UpgSupplementver1.pdf

Our emergency EPROM shipment arrived! All remaining DSP-599zx Upgrade backorders will be shipped by Monday, August 14. U. S. customers should have their upgrades by the Aug 18.

If you are a registered DSP-599zx owner and haven't heard from us about the DSP-599zx upgrade, it is possible that your email address has changed since you sent us your warranty registration card. . About 75% of the email announcements bounced - primarily those involving AOL, Compuserve and changed callsigns. Send us your current email address and DSP-599zx serial number to get our database updated. (Send it to sales@timewave.com)

I have recently changed my PC and am having problems with my TNC. My old PC had a 25 pin serial port, while my new one has 9 pin serial ports. Could anybody supply the info for wiring a 25 pin lead to a 9 pin pleae. I need pins 1 - 8 and 20 on the 25 pin (TNC end) to be connected. What pins do these relate to on the 9 pin (PC) end.

Many thanks

Jim Dunne G0UPG

Jim,

All you need is a standard 9 to 25 pin connector.. you can get them at any
electroics store, or even radio shack. It's the same pinout as an external
modem is.

Thanks,Don,and everyone else who pointed out this site.

Maybe Eduardo is on vacation,and the psk list is only temporarily shut down.

Have any of you PSKers worked 15/17/30/40 lately?

Not that much activity-yet-but that's a bonus,unless you like trying to work a QSO in between all the traffic on 14.070, during prime time.

Hi All,

Seeing the "other" PSK31 Mailing list is very unrealiable, and all but disappeared, I have started one here in the states... go to Http://psk31.listbot.com or http://www.qsl.net/k8cpa/psk31.htm and sign up!

there are 102 people on there as of last night...

Everyone is welcome!

and BTW: I did get my kenwood ts-950sdx going on psk31... have worked alot of stateside and a few countries... Worked XE1M last night on 20!

Hi All,
I am a bit disappointed to see that no one has released Visual Basic code that shows how to use Moe Wheatley's (AE4JY) DLL. VB isn't the easiest language to use with the DLL and it occurred to me that the lack of code could be because programmers couldn't get past the initial hurdles of

sub-classing, to get to the messages sent from the DLL, and passing Arrays to/from the DLL. I have quickly written some code that decodes the PSK signal and shows how some of the Moe's functions work. I am working on the transmit side but have to admit that it doesn't work yet. My reason for writing this is to show others how to get past these initial hurdles. If you are a VB programmer and would like to write a PSK31 program using the DLL I will send you the code I have. (if there are too many requests I'll put it on my webpage) Note that this code is no use to you unless you have Visual Basic 6. I am not releasing a compiled usable program for PSK31 because I think there are more than enough simple programs already. If you want the code e-mail me and confirm that you have Visual Basic 6 so that you can compile it. If the above means nothing to you then PLEASE do not request the code!
Colin MM5AGM

They usually are different. The TNC to Radio baud rate may be 1200
baud while the TNC to Computer (serial port) baud rate is usually much
higher (9600, 19.2, etc). The serial port uses a handshake (hardware
or software) to control the flow of data from the computer and prevent

the buffers in the TNC from overflowing. A higher baud rate is used on the serial port in order to quickly fill up a packet during file transfers so it can get transmitted by the TNC. That improves the throughput. The total throughput is limited by the radio side though. The throughput for 1200 baud is less than 1200 baud because of the packet overhead (addressing, CRC check, etc). The more "real data" you can stuff into a packet, the more efficient it is.

Memory. A TNC is essentially a big buffer and a modem. With enough
memory you can fill up the buffer and then signal the computer to hold
off until it's through.

The TNC hardware is generally a microcontroller and very low horse-power,
so terminal baud rates are limited.

I've been reading up on Packet radio, and a question was prompted by
something I read, and I can't find the answer. A couple of documents
made a real point of differentiating between the data rate between the
computer/TNC and the TNC to the radio, as if they could ever be
effectively different. I understand data communications well, in
general, and I was wondereing, did I mis-read, or is there really some
effective difference?

I mean, if the highest effective bit rate out of the TNC is 9600, for
example, how can I possibly get more throughput?

Thanks in advance.

The simplest way to do this would be to use APRS. APRS uses ONE frequency everywhere in the USA. It is on 144.390. With a GPS connected, it will show your dad's position to anyone who has access to the internet. It will also send and receive messages. Your Dad will be able to send E-mail, but will not receive E-mail. The station once set up is easy. There is PocketAPRS which will run on a Palm pilot. Of course you will need a TNC to connect the Palm to a radio, and GPS.

For more info on APRS here are some links.

http://www.findu.com/cgi-bin/find.cgi?k4hg-8 This is an example of what you would see from the internet, as your dad traveled.

http://www.qsl.net/kd4rdb/aprs.htm This is an introduction to APRS and more.

http://www.kenwood.net/products/index.cfm?AMA=open&ama_mob=open&radio=TM-D700A&selection=Amateur a radio with APRS built in.

www.radiohound.com info on the TH-D7 APRS handheld radio with Palm link to PocketAPRS

Hope this helps,

Let me know if you need any more information.

Hi all, I started a new list with web viewable content at:
http://www.egroups.com/group/psk31relay

This list is for experimenting with the use of digital ham radio for
relaying messages from remote areas using ham radio to bridge the gap
in communications then the Internet to make the information available
to the public.

Lots more information at site in signature.

Thanks, Dale
Dale Coleman

So, in other words, the instantaneous datarate from Computer to TNC should be higher that the radio DR, but the long term, effective datarate will be dictated by the radio side, right?

I don't know about instantaneous, how about average?

Yes, the TNC will drive the "system" data rate. What normally occurs, is the RF will fail, and the TNC will retry.

The computer should transfer its data quickly to the modem. Modern modems perform FEC and compression on the data, and this takes time (TNC's usually don't do this), so you don't want to dribble the data in, you want to overdrive, and let the modem tell you when to stop sending.

True. The system throughput is always limited by the slowest link
which in this case is the radio side.

Is it just me, or is this too good to be true. How many other companies would think to do this (post a general update on a news group). Needless to say, I don't own any Timewave equipment (I do have an old AEA PK-12), but if I'm ever in the market I'll remember this. Customer service is not dead!

I could be wrong.  But I think you may need the enhancement board to run
Pactor with the KAM.  You may want to ask KANTRONICS.

Sounds like someone is using a ham radio on a commercial frequency. Something about that radio not being FCC type accepted for commercial frequencies??

There is an error in the URL address for the DSP-599zx Upgrade manual
supplement. It should read:

http://www.timewave.com/Acrobat/DSP599UpgSupplementver1.pdf

Thanks to John, VE3NFK for finding the error and telling me about it.

Hi,

I am trying to locate a Science of cambridge (Later to become sinclair) Mk14
computer. The computer was available in a home built kit in the UK and, from
what i am led to believe, many were sold to amateur radio enthusiast, as, at
this time they were the only people experimenting with electonics in the
home build environment. (Hence my reason for posting in this group)

If you have one, or any spares, or indeed any sinclair items ie radios,
calculators, watches, etc, working or otherwise, that you would like to sell
please email me as i cannot regularly access newsgroups.

I would also possibly be interested in early home computers from the late
1970 to the late 1980s. Preferably boxed but all will be considered.

Thank you in advance.

david.oharrow@btinternet.com

I just received my Alinco DR-135T yesterday. Just a short note, based on preliminary tests - the radio seems to run quite well at 9600 bps with the integral TNC. What a change from the "9600 bps ready" radios that have such awful bit error rates! I'm going to try it in KISS mode next...

I am trying to get a PSK31 setup going at home. I am able to get reasonable copy with a Sony Vaio laptop, but it belongs to my company and they want it back. My desktop machine is definitely not FCC type accepted. It uses a SuperMicro main board with a PIII 550 MHz CPU. I assembled it myself with generic parts from a local comptuer store. When ever I turn the desktop PC on, my receiver on 20 meters get several S units of noise covering all but the strongest signals. When I disconnect the antenna the noise disappears completely. The rig is around the room from the computer, about 6 to 8 feet or so. The antenna is located on the my apartment balcony at least 15 to 20 feet away.

My gut feeling is that the PC is not worth the trouble of trying to clean up. Perhaps I should try other PCs or find an older Pentium type laptop. Would buying a name brand PC with some sort of FCC type acceptance help. Does anyone have any suggestions? I am open to ideas.

Make sure it is the pc and not the monitor. My experience says that the problem
is in the monitor. Turn it off and see what happens.

Hello all, This is my first attempt at posting a message on the Newsgroup.
There is not a great deal of activity here in ZL land on digital modes. I am
currently working my younger Brother ZL3GE who is in Timaru in the South
Island while I am in Auckland in the North Island. We are going great guns
on PSK31 on 40 meters around 1600 hours our time 0400Z. and there are no
other signals monitored on this band.
I have worked some U.S. stations but propagation from here seems to favour
the european stations.
Cheers all 73............Gerry ZL1AWW

There are several GUI (gtk, motif, etc.) front-ends for psk31lx (which
is text-based). See http://radio.linux.org.au and search on "digital".

My old C=64 finally died. It's been through a few power supplies over the years, and now I think the whole thing is just plain tired.

Trying to stay away from eBay, I'm looking for a reputable source for C64s and power supplies that deals mainly in like-new or reconditioned units.

I wold rather keep with the 64 since it runs my PK232 and a satellite tracking program and I really don't feel like changing all the parameters of a new (different) computer.

Any help is greatly appreciated.

Thanks,

Tom KB2FIK

Hello all,   I have recently been operating PSK31 mainly on 20 meters. Sometimes when I have called CQ I get a signal coming back without a proper preamble of my callsign de the other callsign and I don't know whether the station is coming back to me or starting to talk to some other station. I notice this a lot also on CW where stations responding to a CQ come up with just their callsign.
This is a plea to please think of the fellow at the other end who may have QRM or QRN and under such circumstances it is good operating practice to give his callsign clearly at the commencement of a QSO.
My own practice is that if I am responding to a CQ I give the station called at least three of his callsigns de three of mine so that it is clearly determined who is calling who.

Hi guys...

I've been busy playing today and have set up an English Web Site for MMTTY.

http://www.geocities.com/mmtty_rtty/
(if your typing this out, there is a _ [underscore] between mmtty and rtty)

I'm sure that there are things that can be changes in time and I'm open to your input. I will do my best to keep it current subject to available time. I hope this effort meets with the MMTTY group's approval.. Especially Mako, I hope this is OK with you.

Don't know what MMTTY is? It is a great RTTY (free) program that works with windows 95/98 and a sound card. The program is written by JE3HHT and up to a few days ago there was no help information in English. Guys in the new MMTTY group have been busy putting together English information on using the program. This is a great example of how we can work together!

Thanks to Andy, Mako and the group for assisting in the MMTTY project.

73 . . Ken - VE5KC

Well, there's 3 programs that I know of that you can use for PSK31...
There's twpsk(which requires LessTif), Phaseshift(which requires Qt) and
gpsk(which requires gtk). I prefer twpsk or Phaseshift.

Check 'em out, I've been successful with both Phaseshift and twpsk.

Where did you look before you concluded there weren't any?

The main three (gpsk31, phaseshift and twpsk) are all in the
Linux archive at metalab.unc.edu, waiting to be downloaded.
I've used twpsk and it works well.

Hi All - I am relatively new to ham radio. I am about to purchase my first
setup and wanted get some advice on the follow products. I would like to
have a portable radio and TNC that I can take the top of mountains when I
hike. Here are the two setups I am considering:

#1: Yaesu VX-5R Tri-band HT   with a Katronics KPC-3

#2: Kenwood TH-D7A (TNC built-in)

I need a simple setup that does not weigh too much or draw too much power.
If you have opinions on the options above or an alternate option, I would
appreciate the advice.

John

>If anybody has got any suggestions I will be eternally grateful.

This can be extremely difficult to tackle, as you could be the victim of a bad motherboard design. First try to disconnect as many leads from the PC as practically possible (start out with only the mains lead) and see if there still is that much QRM.

When there is, there may be hope. You apparently have a leaky (plastic?) case, and should just discard it and build everything into a decent case with metal shielding all around, and fingerstock that interconnects the case plates (very important! a "slot"-formed gap in your case makes all other shielding effort worthless, so watch out for slots along the lid)

When the QRM disappears by disconnecting the cables, it is apparently radiated by the cables. When your cables already are shielded, and you already tried the toroids, just discard or sell the machine. It will be too difficult to make any improvements.

Rob

Hello John

You did not mention what/why use of the TNC. Are you going to use it for packet, APRS, or? There may be some options depending on your intended use and may reduce the size/weight of the radio/TNC you need to pack.

Trying to purchase a new house without Antenna restrictions or covenants is really difficult and
I'm a little bit confused on the FCC policies concerning the private contractual agreements.
(I snipped the FCC's comments on a petition that was presented by the ARRL)

I was told by a real-estate agent that restrictions and covenants are similar to leans against the property and
are held as public record at the County Dead Office. They are not signed by or agreed to by persons that
purchase the property. They are adopted by the land developers and I guess you can that they are policed
by the Home Owners Associations!

If I purchase the property and pay cash for it but I don't sign the covenant or agreement. How can that be an
agreement between two parties and how can I be restricted by the covenants?

ORDER

Adopted: November 18, 1999 Released: November 19, 1999
By the Deputy Chief, Wireless Telecommunications Bureau:

-----SNIP---------
-----SNIP---------

III. Discussion

6. The Commission's policy with respect to restrictive covenants is clearly stated in the MO&O establishing a limited preemption of state and local regulations. In the MO&O, the Commission stated that PRB-1 does not reach restrictive covenants in private contractual agreements.17 The Petitioner argues that enforcement of a covenant by the court constitutes "state action", thus converting what otherwise would be a private matter into a matter of state regulation and, thus, subject to the Commission's limited preemption policy.18
Notwithstanding the clear policy statement that was set forth in PRB-1 excluding restrictive covenants in private contractual agreements as being outside the reach of our limited preemption,19 we nevertheless strongly encourage associations of homeowners and private contracting parties to follow the principle of reasonable accommodation and to apply it to any and all instances of amateur service communications where they may be involved.
Although we do not hesitate to offer such encouragement, we are not persuaded by the Petition or the comments in support thereof that specific rule provisions bringing the private restrictive covenants within the ambit of PRB-1 are necessary or appropriate at this time. Having reached this conclusion, we need not resolve the issue of whether, or under what circumstances, judicial enforcement of private covenants would constitute "state action."

Jack, I believe that a good way to view a covenant is that it represents a legally binding set of conditions on the *use* of the property to which it is attached. Covenants are filed with the County Clerk - at least in Texas - along with deeds, etc. The complete "package" for a piece of property consists not only of a deed, etc. but also of any covenants that have been filed.

So, there is no notion of a contract as I see it when you purchase a piece of land with a covenant filed on it. It spells out conditions of use which are legally binding. Effectively, you accept the conditions of use when you accept title to the property. If there are any elements of a contract, then you have effectively signed and agreed to the conditions when you accept title.

Now, this may be the situation only in Texas, but I believe that it is fairly universal.

When I bought this place (Texas talk!) I made sure that there was nothing that precluded antennas and amateur radio operation.   <:}

You could buy one designed for the NASA, they are so well shielded that you cannot detect them, of course, it may cost a bit, and it may take a bit of espionage, but hey, worth it no?

Your real estate agent is correct. By becoming owner of the property you automatically accept all covenents and restrictions recorded with the county even though you did not personally sign off on them. The real kicker is that one of the covenents is usually that you agree to abide by the decisions of the governing board of the homeowners association. If 15 years from now they decide to restrict antennas you may be prevented from adding any new antennas (existing antennas my be grandfathered).

The only solution is to move to the country I guess.

Hi Hugh,

I intend to use it for both packet and APRS. I have a number of small
handheld PDAs (HP LX200,...) that I can use as a terminal. Recently, I
purchased a Garmin GPS that I could hook to it and use it for APRS.

Just got myself a laptop for the shack, P75 with Windows95. Rather than
trawl endlessly through the various packages on offer I wonder if any one
has advice or recommendations as to which software I should load up. I'd
like to try SSTV, RTTY, PSK31 for a start, either via an adapter (which I
have) or, preferably straight into the Mic in socket on the laptop. Also, a
grey-line, great circle and sat tracking prog would be nice.

Thanks for any advice you can offer.

Martin - G4EFE

I also live in Texas, am NOT an attorney, but spent 6 years on a city planning and zoning commission in a suburban city. In this state covenants are attached as has been stated, but they are not enforced by any government agency, but rather by homeowners associations. If a development is sold with covenants, but there is no HA created, then those covenants are effectively null and void. A single neighbor could have the potential for forcing litigation, but then they likely would have to call into question all violations to the covenants effectively taking on the whole neighborhood. Not impossible, but not likely.

I won in a covenant battle over my 55 foot tower in Tucson Az. Actually it was damn easy. I claimed 'selective enforcement' by finding and documenting over 50 various violations of the covenant in my small neighborhood. The pond-scrum-sucking lawyer for the builder (there was still some construction going on) eventually threw in the towel. Didn't cost me a dime except for the processing of the pictures.

Den replied:
I use TrueTTY for RTTY and PSK-31. It is great for RTTY but lacks a bit on PSK-31 recieive in noisy conditions. I like the convienince of just one package. The author also wrote Logger which works with TrueTTY. For PSK-31 there are better performers: Digipan, WinPSK, WinPSKse etc.

For Sat tracking there are a number that are good. One of the best is SSTPlus @ http://www.dransom.com/ designed to track the Shuttle it does a nice job on Amateur sats too! also shows grey line etc...
Also check out : http://celestrak.com/ a bit more complex but another nice sat tracker. There are more....

Obviously you will need more than program... I find it fun to have as many as I can and compare them!!! You didn't mention a logging program but you should consider one of those too! There are MANY. I use LogEQF ... it does almost everything a logger should and I have been using from the days when there were very few to choose from. I like its simple interface... some of the Windows loggers give you too much information!

You also may consider more than one computer..... I find 2 is the minimum.... one for logging and one for tracking or PSK etc. I have three networked together @ Command Central.... at times wish I had 4!
G'luck in your search...

Newsgroups: rec.radio.amateur.digital.misc

  After many years of development and use, it looks like my moderate
speed (230-500 kbps)
packet hardware system is looking for a new home and caretaker. This is
hardware assocated

with the system described in the ARRL Computer Networking Conference proceedings:

system:
    http://www.sonic.net/~n6gn/arrlcnc/cnc.html
radios:
    http://www.sonic.net/~n6gn/230kbps/230kbps.html
antennas:
    http://www.sonic.net/~n6gn/antenna/antenna.html
digital interface:
    http://hydra.carleton.ca/articles/hispeed.html

It has been in use in Northern California over the area

    http://www.sonic.net/~n6gn/local/map3.gif

for about 10 years buthas recently been taken off the air and Internet. I am now finding
myself moving on to other things and it seems a shame for useful hardware to sit on the shelf.
The system consists of:

RF Hardware
    Six complete:
        radios, described above
        antennas, yagis as above
        Ottawa PI2 digital interface cards, described above
        cables, radio->ECL/TTL_interface and ECL/TTL_interface->PI2
        Some 9913 antenna Coax is probably available too.

Host PC's
        previously running DOS/KA9Q but now running Linux to host the PI2 cards and nodes as well
        as internet services are also available. It should be noted that due to a PI2 card-host
        interface issue, older motherboards as on 486's tend to work best. So even if you have
        newer hardware to run on you might want to consider at least a couple of these just to
        have a running link or two as you bring up the rest. See the PI2-users distribution
        list for details on this known problem.

Over the last several years the system has handled many gigabytes of traffic over a ~100 mile network
of paths and is capable of handling many more. The 10 watt radios along with the simple yagis can
each support 50 mile or longer hops and the combination might make a good backbone system for handling
both conventional AX25 as well as TCP/IP traffic over a wide area. We have hosted web pages, run a
wide variety of tcp/ip applications, games, digital telephony, remote access/control over the system

and with the combination of speed and Linux 'development' environment many interesting uses yet remain to be discovered.

I am interested in selling the hardware but also in seeing it continue to be put to good use in amateur service. While the system has been working fine, installing and maintaining a modest speed, wide area network requires effort and some expertise (which can be learned) in a variety of areas including propagation, RF hardware, digital interfaces, operating systems and networking concepts in general. It should not be taken on by somebody who only hopes to get a turn-key wireless network at a bargain price.

If you are interested in this system please contact me at n6gn@sonic.net and I'll be happy to discuss it further.

Thank you for reading my plea for help.

I am having a little trouble getting that fine digital program 'BTL' running.

Do you have that program installed ? and does it run okay?. If any person reads this, and can help me with the config,s, or whatever is required, I would be very grateful indeed.

Hi:

I have picked up a NEC Ultralite 286v to use with my TNC and I am missing the utilities disk that comes with it. I need to get into the BIOS and change a few of the settings. Does anyone have this disk that they can zip me up a copy and send to me. Any help in this matter would be greatly appreciated. Tnx.

Work for free!

Our local group can and shas provided a couple dozen trained peope to work
as weather spotters, and both support and communications durring emergencies
with chemical spills.

> Unless that ARO is current with the emergency network's protocols, is
> that ARO a help or hindrance?

We are trained and receive picture ID cards that give up access directly to
the EOC. <:-))

We provide primary communications (related to weather) during weather
emergencies and secondary, or backup to others.

Roger (K8RI)

The software does exist and it depends on which of the digital modes you want to work.

One of the slickest RTTY,Amtor,CW programs COMPRTTYII runs on a DOS machine and uses a simple basic TU. The 8086/88 machine I have here still runs it. And it evens works great on my P3.

For PSK31 my old 486/33 with 3.11 runs PSK31 for Windows, from Peter G3PLX just fine...

Not in my country -- in Australia it is for experimentation.

From http://www.aca.gov.au/publications/info/amateur.htm:

"What is an Amateur licence?

An Amateur licence is issued to authorise a station that:

* is operated for the purposes of self-training in radiocommunications,
  intercommunication using radiocommunications and technical
  investigation into radiocommunications by persons who do
  so solely with a personal aim, and who have no pecuniary interest in
   the outcome of the operations of the station;
* is operated on amateur frequencies or amateur frequency bands; and
* may participate in the amateur-satellite service.

The Amateur Service is designed primarily to facilitate hobby
radiocommunications and for technical experimentation and operates
on specified frequency bands. Amateur radio operators communicate via
a number of transmission modes including, but not limited to,
morse code, telephony and data. "

For all practical purposes, either definition of purpose is essentially meaningless to Amateurs. Why? Simple. If I was to say that I wasn't going to train myself for national emergencies (US), or do experimenting (Oz), would I (could I) be penalised in any way?

All of that preamble waffle in the licences means essentially nothing when it comes to the practicalities how Amateurs must conduct themselves. Such statements are ideals, not mandates. You can tell the things that are mandated. They have penalties for non-compliance.

In Amateur Radio, if it's permitted, then you can do it for any reason that you like.

Mark.

If you don't want to go with a radio modem like a Baycom or Tigertronics but a TNC, the Paccomm PicoPacket TNC is the ticket. It's small like a pack of cigarettes. It has a jack to plug in a battery. It also has an optional battery pack, optional 2nd serial port, or even the option of a built in GPS. Check out:

www.paccomm.com

I use my Pico with a Casio handheld PC & an Alinco HT. I could run APRS either for CE or when it's connected to my old 486 laptop, I can run WinAPRS.

Good luck & 73's.

Hank Oredson <horedson@att.net> wrote:

> It was simply that proficiency in morse code is not very difficult.

For you, Hank. I have seen others struggle for a long time to get up to 5 wpm and pass the test.

Consider, too that when you and I learned the code, we started at 5 wpm and had PLENTY of people to talk to, letting us get to a higher speed "naturally." That is not really true today; a ham licensed at 5 wpm does not have the same QSO opportunities that we had, so the only practical way to get from 5 to 13 wpm is by listening to W1AW or using one of the code-practice softwares. It was NOT a natural for me; it took me about 8 months of 2-3 hours on-the-air operating every day to get to 13 wpm. If the only way I could have done it was by code-practice tapes, I would NOT have gone on to become a proficient CW op.

Consider too that when we were struggling at the 10 wpm barrier, we could tune the shortwave bands and hear lots of Morse CW sigs in actual use. I understood WHY I was being asked to learn this Morse thing; it was relevant to the radio technology of the day. When someone tunes the SW bands today, it is not at all likely that they will hear a Morse signal, so they do not get that positive reinforcement that we did.

What was easy and natural to us in 1960 is not as easy and natural in 2000, because many of the factors that made it so easy no longer exist. If it looks different to the newcomers of today than it did to us, it is because it IS different.

Now, from 13 to 20 wpm IS a bit easier; there are plenty of stations one can work at 13, 15, 18 and then 20 wpm. And you are right, those contests can be an excellent on-the-air code practice.

73,
Ed Hare, W1RFI

Reread the original posting. The poster was looking for digital
modes *with a sound card*. Which does not mean "a DOS machine"
with "a simple basic TU".

Sheesh.

It depends on your use, are you looking stand-alone or something connected to a computer?
What mode(s) do you want to use and options?
You need to figure these out, then see what units offer what you want and pick one.
Obviously a laptop would not last long on batt. power so it looks like stand-alone operation, maybe with a Nicad batt. and a solar cell charger, remember even simple can get expensive.

Do you have call letter license plates?

In Michigan to get call letter license plates you are really volunteering you and your car for emergency services and are subject to call when such arises.

Probably why they only cost $2.00 extra.

Hi!

I'm writing to let you know that you can post NYC real estate listings and jobs on our site for FREE! Please go to http://www.PeoplesList.com and click the ADD A LISTING BUTTON.

PeoplesList is a non-commericial online community posting site that offers real estate listings, job listings, personals, community postings and a whole lot of other stuff, all at no cost, and with no advertising banners.

Please feel free to post as often as you like, and email us if you have any questions!

Sincerely,

Gavin, Jimmy, & Paul

The new version 5.0 firmware for the DSP-599zx is shipping now. All back orders and dealer stock upgrades should be in place by early next week. For anyone who purchased a DSP-599zx after 01/01/2000, they can contact Timewave for free upgrades to version 5.0. All dealer stocks will have the upgrade kit in the box and will be marked with a sticker showing the upgrade is included. Be sure to ask your salesman.

Version 5.0 provides something for everyone:

Improved noise reduction algorithms for better clarity and wider bandwidth for SWL and broadcast listeners.

CW ops get two new tools, CW Spotlight for isolating the signal you want to work, and Binaural CW for copying that signal.

PSK31 and new digital mode ops get new PSK 31 filters, SSTV filters and PC/RADIO mode used to connect the soundcard audio in and out, along with PTT to your radio.

CW oscillator mode for practice and as a tool to check out TNCs and keyers.

Tanks for the bandwidth, This reaches hams world wide and in real time.

John,

Can you shed some more light on the PC/RADIO mode.

How do you connect the sound card's audio in and out lines to the DSP-599zx?? Can you adjust (and attenuate) the audio levels to and from the sound card?? Does the DSP-599zx provide any audio isolation??

Rob

> alone the POW tap code.

Tap code aside...... if you hang in there, Steve, you will find that
at around 25wpm or so, the code becomes fun and conversational, rather
than mundane copy.  Once you reach that kind of skill level, then, it
becomes just like talking on the fone, or the Inet.  But, you will tend
to find that those that can an do run that QRQ comfortably, have a lot
to say, good yarns and history to spin, and can be great fun in a
round table group of a dozen or so.  You will also find, that once
you reach that threshold, you really don't need the certificates and
the diplomas with the gold stars.... the proof is then in the pudding,
i.e., the ability to use the code.  That is where it is at......

Good Luck, and hang in there.....

Do I at LEAST GET HALF CREDIT for mentioning PSK31 for Windows by Peter G3PLX which runs just fine Running under 3.11 on my 486/33.

Which while its "Unlikely to do the Job" becuase doesn't it have "brute CPU power" and being this slow most certainly "will not be viable" Runs just fine. Althought I probably shouldn't even have thought about using it as its only a 486.

What was I thinking..?
Sheesh

Here is the info from their web site... http://www.timewave.com/

Timewave Technology Inc. has extended the leading edge technology that has made the DSP-599zx the #1 signal processor in HF communications. Today, you can find the DSP-599zx and its technological derivatives in commercial, government, aviation and military HF communication systems worldwide! But we didn't build a flash-in-the-pan - when the DSP-599zx was designed in 1995-96, we looked forward and created a hardware and software architecture to carry us into the next millenium. The following new features are founded on that powerful architecture.

. Binaural CW
Binaural CW enables the CW operator to use the powerful combination of his brain and both his ears to separate CW signals in a panorama with lower pitch signals to the left and higher pitch signals to the right. This exclusive feature makes CW listening easier and takes the pile out of pileups!

. CW Spotlight
The CW spotlight highlights a weak signal to pull it out of surrounding QRM, and allows a proficient CW operator to monitor nearby CW signals while staying focused on a particular signal. This unique feature is great for DX pileups and contests.

. PC-Radio Interface and Filter for PSK-31
PSK-31 and SSTV require connection and matching of a radio's audio input/output and transmit/receive control line to a computer sound card and serial port. The DSP-599zx with Version 5.0 firmware performs these tasks while maintaining the ability to perform its other signal processing tasks. You can now operate RTTY, PSK31 and SSTV with just the DSP-599zx, a transceiver, and a computer with appropriate software. No other interface

boxes or multi-mode controllers are required!

This new feature includes an internal reconfiguration of the signal routing and audio level adjustments in the DSP-599zx that permits the DSP-599zx to be connected directly to a sound card in a computer.

.Noise Reduction Algorithm Modification
We've tweaked the DSP-599zx's noise reduction algorithm for a better low end response for SWLers and improved noise reduction over the entire range.

.Morse Code Practice Oscillator
This one wasn't much of technical stretch for our engineers, but our customers wanted it! Even 5 words per minute takes some practice. Just plug in your key and start sending!
The manufacturer's suggested retail price for the DSP-599zx Version 5.0 firmware upgrade kit is $59.95.

Timewave is beginning production immediately and will begin shipping the DSP-599zx Version 5.0 firmware upgrade kit the week of July 17, 2000. Order now if you want one right away - it may take a few weeks to fill all the backorders.

Look for a special DSP-599zx to computer cable kit to be announced in the next few weeks. Although you can connect the DSP-599zx to a computer with standard cables from Radio Shack, we can save you time and trouble by offering the cable kit along with your DSP-599zx Upgrade kit. We also offer custom cables to connnect most transceivers to the DSP-599zx and the PK-232/DSP and other TNCs.

If it does the job for you, more power to you. I tried it on
a 486/66, wasn't happy with the results, and shelved PSK31 until
I upgraded. My anecdotal evidence (which is all it is) says it's
not viable. Your anecdotal evidence (ditto) says it is.

The logical conclusion is that PSK31 is borderline on a 486.

A beginner might have difficulty getting it to work. Hence the
strong recommendation to consider another approach.

Hello Rob,

I am running an FT1000D with a DSP-599zx for SSTV, HELL and PSK31. the connections are as follows:

Sound card OUT to Audio B IN on the DSP-599zx, 1/8" stereo plug to RCA plug
Line B OUT to sound card in, 1/8" stereo plug to RCA plug
Computer serial port to DSP-599zx RTS in , Standard 9-pin to 9-pin serial
      port cable. NOT a null modem cable
PTT out to TX PTT in on the FT1000D, RCA to 4-pin DIN on my radio
RADIO RX Audio to DSP-599zx Audio in A in, I'm running with -3db
DSP-599zx Line AOUT to RADIO TX audio IN

All of the inputs and outputs of the DSP-599 are programmable. We extended the ranges of these to accommodate a number of different radios. (I used the DSP-599zx to set the line out in the DSP-599zx so the TX is not overdriven. This is the most critical adjustment of the bunch.)

The complete manual supplement for version 5.0 upgrade including the PC/RADIO mode will be on our Webster shortly.

For those radios and systems that require absolute isolation between the radio and computer (most do not; neither my FT1000D nor Randy's IC756 required additional isolation). We will have an announcement concerning those radios that do need extra isolation on the web within the next few weeks.

Hi guys

Despite the fact that I have been licensed on HF for several years, I am a newbie to digital modes. I currently have an AEA PK 900 with which I work vhf packet but I have not managed a single contact on hf on any of the advertised modes (Amtor, Pactor).and one very brief contact on RTTY but this lasted less than one minute.

The rig I use is a Kenwood TS-440S which has been doing a marvelous job all these years on all modes (has FSK mode for data) and is in perfect condition. Some of the names that have come up in conversations with other hams is Hal. I had a Kantronics on loan for a while and was not impressed by its performance - mind you that was a few years ago and the quality may have improved some. It just did not seem able to pick out weak signals.

One of the recent issues of CQ magazibe ran a story on the Hal and the reviewer seemed to like it a lot.

Ideally, I would also like to use it for satellite work (phase rd etc) but it sems to me
that it simply is not possible to get all modes in one package.

I would also like to know which are currently the preferred and most popular data modes

I would greatly appreciate any and all advice from you experienced bunch as to which way to go. Getting the gear to South Africa is not a problem as a friend from New York is coming to visit me in December and has kindly volunteered to bring it along

I am going to post this same message on the other packet boards as well in case some guru only reads the one board and misses it. No offence intended/

73's and all the best

Kind regards

Gerry Pieterse

If you were thinking of CW, and would like to use a paddle keyer.

This is an ORIGINAL BENCHER BY-1 KEYER PADDLE

CONSIDERED TO BE THE ROLLS ROYCE OF KEYERS

Full range of adjustment in tension and contact spacing
Self-adjusting nylon and steel needle bearings
Gold plated solid silver contact points
Precision machined, chrome plated brass frames
Heavily weighted base with non-skid feet
With cable and plug for Yaesu FT-847, Icom IC-746 and others
Black base with Chrome Components
Made in U.S.A.
In as new conditon

I have version 2 running and the concurrent spectrum and waterfall is really nice. Also new is the additional logging features. Also new is more macros.

In fat the only thing missing in my opinion is TRUE capture file ability. It dose let you save the rx buffer but does not let you do a true capture where all is saved as it is received.

It would also be nice to have a key to clear ALL windows or a macro sequence to clear all windows that you could assign to a key.

It is slow to individually clear the Rx1 Rx2 and Xmit windows.

I found that although the help file say that paths do not work for files in a macro, they do. I use path in my macro and it works fine. , <c:\doument\filtest> works fine in a macro.

This is good because rearguing them to be in the exe folder is not good.

The only problem I had is that if you try to change all the font things at the same time it crashes the program, not the system (WIN2000 though) and you have to restart and lost all the changes.

It also crashed when I tried to use Tune Key while the rig was turned off.

All in all , very nice program. It is hard to decide between this and Zakanaka.

For me, on Pactor, at least, I need to send a 'really long CQ' in order
to get responses. Typically, I'll make a macro for my COMM program,
and let it run for awhile, while I do other stuff -- but within ear-range, so
I can man the keyboard if someone comesin.
Do you hear people trying to call you, and it doesn't
connect? Or are you just not getting any response at all?

If you look in the SoftKiss folder, you should find a picture of the diagram.
I'm not sure this version has it:

ftp://oak.oakland.edu/pub/hamradio/mac/digital/NET_Mac2.3.57.sea.hqx
(or in that directory)

If you can't find it, let me know, I'll e-mail it to you.
The PowerBook 145 should be fine. I think there was something you had to

do so that it doesn't turn off the serial port to save battery power. Let
me know how it works out, I'll be trying to get packet working on my Mac
anytime within the next 3 months...(time permitting)...

To reply remove the *nospam part.

best,

Erik

Mark Little <mark@brigadoon.apana.org.au> wrote:
>"Kenny A. Chaffin" wrote:

>> The purpose of ham radio is not to grow and have fun and stay alive. The purpose is for the nation to have a trained set of knowledgable radio enthusiasts that could be drawn upon in case of national emergency.

>I think this is but a pipe dream. But perhaps I am being unnecessarily pessimistic (given that I work in related fields). Perhaps you can expand on what you mean. What can an Amateur Radio Operator (ARO) do that could not be done by a trained emergency organisation operator?

I can provide an example from here in Hawaii. The counties ("islands") are almost completely dependent upon amateurs to provide emergency comms during disasters. Here in Oahu County, we have 150 evacuation shelters run by the Red Cross, and each is manned by a ham for comms back to RC HQ and the civil defense EOC. Oahu RACES has over 100 members, willing to respond at a moments notice to provide comms. Each police sub-station has amateur equipment in which RACES members will man during an emergency. Amateurs have installed repeaters to support Oahu County during disasters.

Now you ask, "what can an ARO do that can't be done by a trained emergency organization operator?" Consider just the cost alone of the county funding the above manpower and equipment which hams provide free of cost.

This system was put into operation just this last weekend when the state was threatened with an approaching hurricane. As usual, it worked smoothly, (with yours truly getting his picture on the front page of the newspaper [see: www.honoluluadvertiser.com/2000/Jul/31/index.html]).

In addition, all hospitals belong to the Health Comm Network with each hospital having licensed amateurs on its staff. During a disaster, these hams provide intra-communications between the island's hospitals sharing information regarding number of beds available, supplies on hand, supplies needed, along with a dozen other vital pieces of info.

>Unless that ARO is current with the emergency network's protocols, is that ARO a help or hindrance?

We offer numerous training sessions and exercises which are usually well attended.

>Being both a professional in radio and an Amateur, I don't have such a Black & White view of the radio world. Hobby activities have a much broader function that providing a pool of people trained to professional level in that activity - usually, they don't.

Note that the U.S. Government, in its regulations, never refers to amateur radio as being a hobby but rather a service. Our charter reads as follows:

97.1 Basis and purpose.
The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:

(a) Recognition and enhancement of the value of the amateur service to the public as a voluntary non-commercial communication service, particularly with respect to providing emergency communications.
(b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.
(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communications and technical phases of the art.
(d) Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts.
(e) Continuation and extension of the amateur's unique ability to enhance international goodwill.

> IMHO, the main advantage
>of a hobby activity is to provide a wider community appreciation of that
>area of activity.

Does your Australian government consider amateur radio a hobby?

I have a PK-12 that I'm trying to get working with winAPRS.   It seems to be getting data from MIC-E (a TinyTrak actually) wrong. I have set afilter to off, and mfilter to 0, but no help.   At first it was just dropping a digit from the longitude, but latitude also doesn't seem right.   Same thing with my PK-232.   Has anyone else had this problem or have any ideas?

big snip..... You know this world is just full of funny things. There is a limitless supply of situations which would justify comedy. The death of 100 plus people is not one of them. I only feel sorrow for the writer or sender of these "jokes" as he apparently does not share the loss even in some small form of 100 plus souls and the sadness that befell the thousands of family, friends, co-workers and such. I pray that those who died have eternal peace, that the family and friends also find what peace as can be had on this earth and also for the writers and senders of such "humor".

God Bless ..... Tom KI3R

It's hard for me to believe that the next president of the United States will be George W. Bush or Al Gore. Both remind me of Hollywood movies that have been focus-grouped to death: they push all the appropriate buttons, but have zero original vision. Both stand for the same thing: corporate-driven business as usual.

There must be some way outta here.

Ralph Nader is no joker or thief. I think he and the Greens could give Al & George a good run for their money. At 65, Nader isn't running as fast as he used to, and the Green Party doesn't exactly have its platform figured out, but I think they have what it takes to inject a dose of radical democracy into the race. Unlike the two Tweedles, Nader is real, he stands for decency and common sense and he still commands a lot of respect in progressive and activist circles. And hidden behind the rainbow coalition of lefties, eco-feminists and crazies, the Green Party does have some great ideas. It's the only party that stands for the Tobin Tax, true cost markets, media reform and putting corporations in their place.

In October, with a fired-up Nader hurling intelligent sound bites into the presidential debates, the whole game show might actually be worth watching. The alternative is the most sophomoric presidential race in American history . . . and the lowest voter turnout ever.

I'm putting a GO GREEN - VOTE NADER graphic at the end of all my emails from now on. I'm betting that, between now and November, the American people will wake up to the fact that their sacred democratic experiment has now degenerated into a choice between a corporate-sponsored Republican and a corporate-sponsored Democrat.

In these heady post-WTO days, a sudden, massive protest vote against Al & George is entirely possible and Nader would be the most apparent heir. With perhaps less than 25 percent of the people voting, an inspired Nader campaign could grab a surprising share of the action. And even if he does not come close to winning, at least imagine how his campaign might pull together some of the fired-up, post-WTO forces and lay the groundwork for something really visionary in 2004.

Download the graphics and help launch an email pyramid scheme to dump the Tweedles! Two formats are available, a magazine sticker (17K) or a Banner ad (5K):

Sticker ... http://adbusters.org/magazine/30/nader/tweedles.jpg

===

What it Means to be Green

"At the root of all Green political action is nonviolence, starting with how we live our lives, taking small, unilateral steps toward peace in everything we do. Green politics requires us to be both tender and subversive. Affirming tenderness as a political value is already subversive. In Green politics, we practice tenderness in relations with others; in caring for ideas, art, language, and culture; and in cherishing and protecting the Earth. To think Green is to build solidarity with those working for social justice and human rights everywhere, not bound by ideologies."

-Petra Kelly

Hmm, that @@M10 doesn't look good. Not sure where
that is coming from. Are you in terminal mode, as opposed
to "host" mode?

Find a way to get rid of that, as it isn't in the protocol.

The message <vweaHFCBJsccbq@news.senate.gov>
  from John McCain <john_mccain@mccain.senate.gov> contains these words:

> It's hard for me to believe that the next president of the United
> States will be George W. Bush or Al Gore.

<rest of non-radio.amateur.digital.misc nonsense snipped>

```
So are Ralph Nader, George Bush, or Al Gore active hams to whom
we can pass your diatribe, or have I missed something?

   The posters are a bunch of losers who have been spamming all of
USENET with their adolescent political activism.

   Their website is, however, quite amusing in a useless-to-society
crunchy granola sort of way.

Scary thought! Use of such a high bandwidth medium for such a low bandwidth communication (which due to it's rare transport over such medium isn't even efficiently multiplexed).

It's more efficient to simply send the text, and have the remote machine TRANSLATE it to morse code.

Yes, I agree - but remember this is for pratice purposes.

I hooked up a microphone to my computer, and I went to some Yahoo Chat
rooms. I am surprised at how well it works - I dont' see much delay.

Using chat, I suppose all I need is one of those Morse beeping boxes.
I suppose until I get that, I could just simulate it will my voice!!

There are, nevertheless, PSK31 beacons on this band.

Why not try it and see?

Hey George!! Nice note. I got my General from the Dallas office in about
1967 on the second attempt (had to drive about 150 miles to do it). Yep
the days of solid copy, sending tests, etc. Hang in there, man!!

Best Wishes,
KAC

Actually, there is no math involved, and books won't help.
You need to purchase the nodes and interface cards, and set up
the computers to run the software you design.

Maybe create a newsgroup "reader" that outputs morse code on the computer's
speakers?
Learn code while keeping up with the flame wars of r.r.a.m and r.r.a.p!
:-)

They won't because they will be on different frequencies. Also I was emailing the guy who designed the modem and he reckons that there has been a network in Atlanta using this same system for 5 years.

I'm starting to think that I am wasting my time asking question here. I would probably be better off doing the maths myself and reading books.

My feeling is that Amateur Radio and the CW mode would be better served by eliminating the code exams entirely. Then those who actually want to learn the code will do so of their own volition.

5, 10, 13 and perhaps even 15 wpm garrantees failure for majority of candidates, along with unecessary frustration and anguish. The intial target speed SHOULD be at least 18 wpm.

At 18 to 22 wpm the overwhelming majority of candidates will pass easily. No fuss, no drama, no angst.

Challenge: Obtain a copy of David Nye's (KB9PSL) Freeware Morse Code Trainer (abt 35 kB DOS) and start from scratch at 22 wpm. 3 to 4 weeks of half an hour a day, seven days a week WILL have you copying 22 WPM.

It is that easy.

73,   Cynicus.

Exactly right. There are many things the Internet can do, but there are also many things it can't do. Posting questions is no substitute for in-depth background.

If people are really serious about communications and stuff, I routinely recommend Communication Systems by Haykin, and Digital Modulation and Coding by Wilson as places to start.

"... reasonable extent ..." in my book is better than 25 wpm.

(That's a speed you would obtain by simply operating for a
few years ... it's no big deal)

Ed, I think you are putting the bar way too low.

As a kid in high school, I found it easy to get to 25 wpm, and not all that
hard to get to 35 wpm. If ya wanna do it, ya spend the time and learn it.
Running liason between traffic nets will get that speed right up there ...
... as will trying to win sweepstakes ...

I need a Mercedes, plain and simple ... I'll be very direct about this.
I'm retired and living on a small fixed income.
But I really really want a nice car, so somebody send me one.
Now.

Randy--

You may have already solved your problem by now.

But some of mine get shelved for weeks/months, so here goes:

If you have fed the Tripmate its output back into its input
so it sees its own "ASTRAL" string, it should initialize itself
and start spitting out NMEA sentences.

Try using a simple comm program like Procomm, HyperTerminal,
etc. and see if you can view how it is behaving. If it is
initializing, then the problem must be in the D700a or the
interface.

Also, some D7a's had this firmware situation:
http://www.qsl.net/n6qab/kensb.htm

I don't follow the D700a since I don't own one (yet) :).

Just a thought.

You've got an idea there. I wonder if modems could have
intercommunicated with CW. Isn't the sound you hear
from your modem actually some form of FSK? Data?
Or is it closer in lineage to packet?

G3VFP is now selling a both a kit and a completely assembled sound card

interface USING OPTO ISOLATORS THROUGHOUT (unlike RigBlaster which does NOT use opto isolators on the audio lines). G3VFP's unit isolates BOTH the receive and transmit audio lines (unlike RigBlaster which only isolates the Tx line).

There is even a schematic diagram of the circuit for those who want to build their own. See his web page -- http://www.users.myisp.co.uk/~vfp/kits.htm

The assembled unit costs around 23 pounds (or 50 dollars or so).

He even sells an assembled unit the isolates the RS-232 line for rig control.

What did I say?? Someone would sell a less expensive unit for around $50 that provides better isolation than RigBlaster!

> Yes, if you use opto-isolators on the audio lines to and from the sound card you will need to also use op amps and the proper biasing circuitry. Such a circuit is very easy to build and design. G3VFP Has recently designed and built such a circuit. But I don't think that such a circuit would considerably add to the cost of a RigBlaster. (I am not talking about selling price but cost). The cost of the circuit board would be about the same and the extra cost for the additional parts would not be very much. If there was any significant additional cost, it would likely lie in the extra cost in building such a unit. Yes, the circuit must be designed properly but that is part of what you are paying for when you buy a commercial product.
>
> The REAL advantage of using opto isolators is to better protect your computer's sound card from any dangerous voltages coming from the rig or vice versa due to malfunctions or improper installation.

> Yes, I agree that there is always a ground connection between the computer and rig via the AC ground line. Complete isolation is not possible nor desirable. But the real goal of any sound card interface is to break up the ground loops on BOTH of the AUDIO LINES to and from the sound card and on the PTT line. Audio isolation transformers do a good job at breaking up the ground loops on the audio lines.

It is much better to use an opto isolator to key the PTT line.
(for such a circuit, see www.qsl.net/wm2u)

If you use a transistor, you will defeat the purpose of using audio
isolation transformers on the audio lines to and from the sound card.

I guess there must be a reason why this post is on the digital
newsgroup. I'm too dense to see it.

Cash4Surfing

I found this on a bulletin board and decided to try it. A little while back,I was browsing through newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought, "Yeah right, this must be a scam", but like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured, "What have I got to lose except 6 stamps and $6.00, right? "Then I invested the measly $6.00. Well GUESS WHAT!?...Within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week, I had made a total of over $1000.00! In the third week, I had over $10,000.00 and it's still growing. This is now my fourth week, I have made a total of just over $42,000.00, and it's still coming in rapidly. Let me tell you how this works and most importantly, WHY it works. Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy! Suggestion: Read this entire message carefully! (Print it out or download it.) Follow the simple directions and watch the money come in! It's easy. It's legal. And, your investment is only $6.00 (plus postage)

IMPORTANT: This is not a rip-off, it is not indecent, it is not illegal, and it is 99% no risk - it really works! If all of the following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE: please follow these directions EXACTLY, and $50,000.00 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business, your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to for quality lists. However, the money made from the Mailing lists is secondary to the income which is made from People like you and me asking to be included in that list. Here are the 3 easy steps to success:

STEP 1: Get 6 separate pieces of paper and write your name and address plus the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent (thievery). Next, place one paper in each of the envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office 1-800-725-2161) and they confirmed that it is indeed legal. Mail the 6 envelopes to the following address:

1. Julius Tausaga, 2006 A.Fern St. Honolulu, Hawaii 96826
2. Steve Dixon PO box 511 Fairview NC 28730
3. Dan Polzin 7409 Wallingford St. Louis Mo 63121

4. Richard East 356 Grove Ln, Murray, Kentucky 42071
5. Jack Dukeshire 2 Army St, Randolph, MA, 02368
6. Bradley McMillan, RR#4, Winchester, ON, Canada, 12541

STEP 2: Now take the #1 name off the list that you see above, move The other names up (6 becomes 5, 5 becomes 4, etc.) and Add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups) All you need is 200, but remember, the more you post, the more money YOU make! You won't get very much unless you post like crazy. This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of

integrity, the program will continue and the money that so many others have received will come your way. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be

receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business!

---DIRECTIONS----FOR HOW TO POST TO NEWSGROUPS---------
Step 1) You do not need to re-type this entire letter to do your own
posting. Simply put your cursor at the beginning of this letter, drag
your
cursor to the bottom of this document, and select 'copy' from the edit
menu.
This will copy the entire letter into the computer's memory.
Step 2) Open a blank 'notepad' file and place your cursor at the top of
the
blank page. From the 'edit' menu select 'paste'. This will paste a copy
of
the letter into notepad so that you can add your name to the list.
Step 3) Save your new notepad file as a .txt file. If you want to do
your
postings in different settings, you'll always have this file to go back
to.
Step 4) Use Netscape or Internet explorer and try searching For various
newsgroups (on-line forums, message boards, chat sites, discussions.)
Step 5) Visit these message boards and post this article as a new
message
by
highlighting the text of this letter and selecting paste from the edit
menu.
Fill in the Subject, which will be the header that everyone sees as
they

Scroll through the list of postings, in a particular group. Click the
post
message button. You're done with your first one!
Congratulations. THAT'S IT! All you have to do is Jump to different
newsgroups and post away. After you get the hang of it, it will take
about
30 seconds for each newsgroup! (There is a faster way. You may use
Microsoft
Outlook or Outlook Express to select newsgroups rapidly. You just need
one
time "Copy and Paste" to send to all of them simultaneously.)
**REMEMBER,
THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT: YOU
HAVE
TO POST A MINIMUM OF 200** That's it! You will Begin receiving money
from
around the world within days! You may eventually want to rent a P.O.
Box

due
to the large amount of mail you will receive. If you wish to stay
anonymous,
you can invent a name to use, as long as the postman will deliver it.
**JUST
MAKE SURE ALL THE ADDRESSES ARE CORRECT. **Now, each of the 5 persons
who
just sent me $1.00 make the MINIMUM 200 postings, each with my name at

#5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $625.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00!!!Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625.00! With an original investment of only $6.00!
AMAZING! When your name is no longer on the list, you just take the latest postings in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is: do you realize that thousands of people all over the world are joining the Internet and reading these articles everyday? JUST LIKE YOU are now! So, can you afford $6.00 and see if it really works? I think so...
People have said, "What if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, everyday, with thousands of those joining the actual Internet. REMEMBER, play FAIRLY and HONESTLY and this will really work. The possibilities can be endless...You will never know, unless you give it a try... otherwise, it will always be "what if."
GOOD LUCK!

I was running the wa8ded eprom in my 9k6 baud tiny-2 tnc. now i bought the factiry end user eprom
from paccom.It has the lastest revision: 5.0.0
When i run paKet62 or winpac5.4 i get connected to the local bbs,but then just like that i'm disconnected.
It's been so long since I was/ran end user what am i missing in my parameters?
tnx de dave-n2rhl

I thought all the versions of PK232 firmware supported packet. Your PK-232 should already do packet. Give it a try!!

I suspect that you are really referring to Pactor not packet. Yes, you will likely need the latest firmware from Timewave for Pactor.

I have heard that the PK-232 firmware from Timewave works well in Pactor. (But I can't tell you from first hand experience since I do not have a PK-232).

By the way, there is a lot of Pactor 1 activity on HF. Many Hams still use Pactor to access BBS's on HF (though some Ham's have upgraded to Pactor II by buying the PTC II or PTC IIe from SCS). You cannot upgrade the PK-232 to Pactor II.

Believe it or not, the Hayes 1200B modems came with morse code ability. Look in one of the appendices. I think one could take the modem "off-hook" by issuing ATH2, which put the modem in "transmit mode" (and shorted the second pair of wires together), and then periods and dashes sent to it came out as code. At the end of the transmission, one had to issue a special command to keep it "off-hook" but otherwise disconnect it (i.e. "receive mode"). Too bad that it didn't actually receive the code too.

Hi all, Dale KF4SIR will be testing sending messages using PSK31.

The first test of using PSK31 to relay e-mail messages will run on August 12, 00 starting at: 12:00Z and running to 14:00Z using the normal BPSK mode then from 14:00Z to 15:00Z using the QPSK mode. Weather permitting (I live in thunder storm alley) - I will try and run a second session August 13 (UTC) from 00:00Z to 01:00Z using QPSK mode then from 01:00Z to 03:00Z using BPSK.

Should be interesting to see how the QPSK mode does.

In a effort to prevent QRM on the normal QSO frequency, will be running contest style auto CQ on 14.090Mz + 1500Hz or so. Look down if frequency is busy.

Will only be testing the outbound relay leg at this time. So please stop by if you can, you will just have to copy one short message then be on your way.

For more information please see:
http://psk31relay.net

Thanks, Dale

They do all support packet....problem is I
have a PK232 with NO eproms. I just want
to find a back rev set to try it out and see if it works and to see what is happening on
packet. Thanks for the reply.

I don't think it should be any made any harder to get into Amateur Radio.
If we make it any harder, before long there won't be any new hams, and Ham
radio will be dead.
As far as I'm concerned, you could get rid of the code requirement

altogether. I still think code is very usefull and fun, but it is going to
die out eventually. Especially with modes like PSK now in use.

The eeeeennnnnnnddddddless code-no code debate.

The purpose of ham radio is not to grow and have fun and stay alive. The purpose is for the nation to have a trained set of knowledgable radio enthusiasts that could be drawn upon in case of national emergency.

It could be that the nature of the trained enthusiasts needed no longer makes sense in the modern world. Current commercial and military application of radio is quite technical and complex. Perhaps the hobby should change to keep pace with it --- or maybe it should die.

Hi David,

The "tigertronics BAYPAC things" work just great for packet. If even used it on an old 8088 laptop, floppy drive only with DOS packet software. You can't beat it for size and that it requires no additional power supply. Just plug it into your serial port. They even work great with the right windows software, despite what Tigertronics says on their web site. I used one for over a year running Winpack. There is lots of info on making it work on internet.

I have the Tigertronics BP-2M multi-mode unit. I never had much success on HF using Hamcom, the most recommended program. I almost gave up on HF modes until I found a "freeware" program called Intercom by PA3BYZ, which works very well for CW, RTTY, ASCII, SITOR FEC, FELDHELL, (RX only) SITOR, ARQ & PSK. (http://ourworld.compuserve.com/homepages/pa3byz/rttymade.htm)

Respectfully, I think you're missing the point. It's all well and good that you had to walk through the snow to school every day, 2 miles, uphill, years ago. But today, there's a faster route to that school where we don't have to go uphill and the snow plows keep the roads clear. Should we keep taking your route anyway?

Morse used to be the only way radio op's could communicate. Working at 25-35+ wpm was a legitimate skill every radio op needed to have. However, in 2000, it has become fairly obsolete. Even the Coast Guard quit listening for it years ago. I hate to say it, but it seems little more than an enjoyable, challenging, ham pasttime any more. Who else besides us is using it?

A viable means of communication? Definitely. A good thing to learn?
Probably. It shows dedication to the hobby and weeds out casual candidates

who would otherwise turn ham radio into CB. A necessity for radio operation? Not any more. Should it be included on the test? Probably not. How does Morse code advance the radio art these days?

It depends on what you need. A real TNC, or a MODEM that can be used to do packet while connected to a PC RS232 interface. The latter can be considerably simpler, as it does not need to contain a CPU etc.

I think this is but a pipe dream. But perhaps I am being unnecessarily pessimistic (given that I work in related fields). Perhaps you can expand on what you mean. What can an Amateur Radio Operator (ARO) do that could not be done by a trained emergency organisation operator? Unless that ARO is current with the emergency network's protocols, is that ARO a help or hindrance?

> It could be that the nature of the trained enthusiasts needed no longer makes sense in the modern world. Current commercial and military application of radio is quite technical and complex. Perhaps the hobby should change to keep pace with it --- or maybe it should die.

Being both a professional in radio and an Amateur, I don't have such a Black & White view of the radio world. Hobby activities have a much broader function that providing a pool of people trained to professional level in that activity - usually, they don't. IMHO, the main advantage of a hobby activity is to provide a wider community appreciation of that area of activity. In a democracy, it is more essential that people (voters) appreciate an activity than understand it in minute detail. AR is a means of providing that appreciation.

Mark.

I think you missed my point.
It was simply that proficiency in morse code is not very difficult.
I didn't say anyone *should* or *must* learn it.
Note the qualifying "If" in the second sentence.

Kantronics KPC-3 is fairly small, low power. Some folks have
modified them to hold an internal nicad.

Heath HK-21 or Telereader uTNC-21 is size of cigaretter pack,
has built in battery, is a TNC2 clone. Nice for portable operation.

I have a uTNC-21, don't really need it, would sell for reasonable price.

Hi!

Don't know if I've got the right newsgroup for this, but here goes.

I've got a 1998 Dodge Grand Caravan, and am trying to find an existing route through the firewall to run 12 volt power to a amateur mobile transceiver installed in the vehicle.

Is there anyone out there that's done this, either for amateur or land mobile gear?

Thanks!
KJ7FD

Be there. Trained emergency operators aren't always there, but there's lots of Hams.

> Unless that ARO is current with the emergency network's protocols, is

A help.

Check out the ARRL continuing education program. Lots of info about emergency communications there, for those of us who are not familiar with the basics.

Hi all,

I need install a Baycom modem on my PowerBook 145B.
My Baycom is in PC DB9 Serial port.
Anyone can send a pinout converting DB9 to DIN 8 (Mac miniDin).

Can I run the SoftKiss (Baycom soft packet) in my old PowerBook 145B?

Thanks for attention.

I felt the same when I passed my general written, what I am going to do is
have a HAM friend give the 13wpm now and my 20 wpm when I take my extra.
They won't do anything for me as far as the exam goes or give me anymore
privileges, but at least I will know that I passed them. Just a thought.
Good luck and 73

I'm not saying that they could or are trained to do what commercial
operators do day-to-day, but to be available to perform those
communications duties if needed. The purpose is to provide a trained pool
of radio-knowledgable citizens.

That's not the purpose, as I said. Have you read the rules recently?
Amateur radio is not intended to be self-serving, which is exactly the
point I was refuting.

True. This must be the first disadvantage to having RS-232 straight
out of the radio though (as my FT-847 does).

Hi, name here is Les.

I have a PCB-88 Packet board, cables, power supply, manuel and programs [3 1/2 and 5 1/4 floppys]. This will work both VHF/UHF and HF Packet.

Works with any IBM or compatible computer with an open slot.

Works even better with XPWin etc.

Asking $100 + shipping.

Reply via E-Mail only to kbtgw@spec.net only.

Hank Oredson <horedson@att.net> wrote:

> "Part 15 devices: Very limited short range plug and pray."

Hams can significantly increase the range of Part 15 devices by easily adding antennas and, with only slightly more difficulty, adding amplifiers. At up to 1 watt of power, these devices are capable of real communications over distance. The Part 15 antenna must be "integral" and not exceed 6 dBi. See CFR 15.247 (http://www.fcc.gov/mmb/asd/bickel/47CFRrule.html). Hams are not bound by the power limit or antenna gain of Part 15, but can use unlimited antenna gain and power as defined in Part 97.

Not sure if 1 W and a decent antenna would reliably do 50 kM over most paths, though. Any good path-loss analysts care to chime in?

Good luck getting Hank to listen, Ed.

I've got a feeling that Hank may live in an area where he would not be
able to make many contacts, even if modified part 15 devices DO catch
on. I've got three places that I stay at in Southern California. For
the short term, my best locale for this work is in an fairly urbanized
area - my parents' house in San Diego. That is why I'm constructing my
tower there. Unfortunately, due to a number of factors, I've had to
scale back my tower plans, and I'm now submitting a building permit for
a 29' tower. To appease my parents, their neighbors, and to stay under
a 30' city-imposed fee level(no fee if under 30' - $90 if over 30'),
I'm only going to be able use 3 sections from the hbx48 I bought.
However, I'm going to build the foundation, and select the lower
section in a way that I could add 16' more some day.

At up to 1 watt of power, these devices are capable of real communications over distance. The Part 15 antenna must be "integral" and not exceed 6 dBi. See CFR 15.247 (http://www.fcc.gov/mmb/asd/bickel/47CFRrule.html). Hams are not bound by the power limit or antenna gain of Part 15, but can use unlimited antenna gain and power as defined in Part 97.

> 73,
> Ed Hare, W1RFI

A guess: yes, 50 km is not unreasonable and longer paths should be possible when done in the ham band with "true optical line of sight paths" and not-too-large antennae. This means point to point links, two ends required for each ham station linked to the network.

Cost of something like this? Less than $1000 per end?

But 50 km is, in my view, "limited short range" ...
For urban or suburban use, in open areas, where the density of hams is high and the density of obstructions is low, these devices might be useful. Won't work here though, since the above conditions do not apply.

So how to build the longer haul network links to hook these fast metro-area nets together?

Hi All,

Forgive me for a slightly OT enquiry, but it is somewhat related to APRS.

I'm considering purchasing a weather station for home use, preferably one that also displays barometric pressure, possibly for APRS use in the long-term. For those of you running weather stations, I'd appreciate some guidance. Currently, I've been looking at:

Peet Bros Ultimeter 2000.

Davis Instruments Waether Monitor II

Oregon Scientific Weather Monitor.

On initial inspection, it looks like Oregon gives the most bang-for-the-buck, as it includes all the items which are 'optional' in the Peet Bros and Davis kits. It also has a cordless version for $499, which unfortunately operates at 433Mhz.

Does anyone have any experience with these models, advice, recommendations, etc? (Email copies of replies would be prefereable, unless anyone else wishes to read the feedback.)

Appreciate any help...

73, Darrell

NR3Y/W6.

I tried it. I like the two received signals feature, but I wish you would have retained some of the user friendly features of WinPSK. Those features make it easier to use. I hope you will consider adding them in future updates. I would also like to see an English help file and some user documentation. All in all, a good start.

Tracy,

The Kenwood units dont have a host mode in them, but they do have kiss mode.
The new Alinco units have the same TNC in then.. (from Tasco, Japan).

One thing we're looking at is a version of our software to use KISS mode in both the Kenwood and Alinco units.

You might try paKet 6.2, available at ftp.tapr.org in /software_lib/terminal. It has features similar to many of the host mode programs but works with the standard TNC command mode.

Take a look at:

Section (a)(3)(i) and (a)(3)(iii)

6 dBi for an Omni antenna, with 30 dBm maximum into it.
6 dBi for a beam, with 1 dB power reduction from 30 dBm for every 3 dB of gain.

Seems at odds with 15.203. But that statute states:

> "...Further, this requirement [integral antenna] does not apply to intentional radiators that must be professionally installed"

It doesn't define "Professionally Installed" but we can assume that they mean an installation that meets the power constraints, and out of band harmonic limits.

I seem to recall the old Bonneville Dam microwave towers were set 40 miles apart
and ran 1 Watt Klystrons into microwave dishes of considerable gain.
31 miles might be a bit much to expect.

Microsats. Lots of them. One a year. Spread Spectrum (DS).

While the Phase III should be considered an honorable mention, the
fact that it is 16 tons means it will probably never fly. The money

spent hauling this 16 tons all over the world and back down to the French military base in South America, could have launched at least *dozens* of these microsats. If phase III flies, it will be about as potent as stuff we had back in 1990.

Laura:

There are parts of your education that have been missed.

Remember the crystal set?

No power required, all of the components readily available from a common garden variety hardware store.

No silicon required, no transistors required, no software required...

Have a look at the Crystal Set Society www site.

Best Regards,

Peter K1PO

How about this idea: You have a digipeater in the middle of your desired area of coverage, with an non-directional antenna. Each station that wants to use it has a low power narrow beam transmitter and reciever antenna aimed at the digipeater. When station A transmits a packet to the digipeater, the digipeater stores it, then sends it out on another frequency, which all stations are listening to. If the packet is for a station off another digipeater, the digipeater would send it on a dedicated link to the next digipeater. Mobile stations would just have to keep their antenna pointed at the nearest digipeater, or use a non-directional anntenna. Please feel free to tell me why this idea doesn't work.

David Findlay

P.S. The digipeaters would all be on hills.

You could have a look at WinPack. It has full support for the TH-D7. See my sig for the download site. When you install it, you'll find a file in

the DOCS folder called TH-D7.TXT, that contains information on how to
configure WinPack for use with the TH-D7.

Also, the TH-D7's with the latest firmware support KISS (older ones
didn't), and there's a huge amount of existing software that supports
KISS mode.

I just put in a Peet Brothers weather station and it works fine. The main reason I picked it was because I'm a programmer, and the programming interface of the Peet Brothers boxes are super-simple, and no hassle. I cooked up a little program for my website

http://berkeleybarb.com

And, if you click on the weather button you'll see temperature and wind direction, among other things. Right now I'm keeping weather stats on my hard drive, but I haven't done any charts or anything like that with them. I'm really busy with work right now.

My program is in Linux and just reads the serial port, decodes the weather data, and makes up a picture to display that has the temp humidity and other things. Then copies the file into the web directory. (Which isn't really 'the right' way to do it, but seems to work okay anyway.)

I opted for the 'radiation shielded' temperature/humidity sensor, since I really wanted good temperature readings, and was a little paranoid about placement of the temp sensor in the sun or near walls and other things. I got the non-heated wind gauge -- since here in Berkeley California it almost never ever gets below 40F. I suspect that my wind speed and direction measurements are a little bit innacurate due to turbulance caused by my antennas nearby. But, the thing seems to put out reasonable readings, and it's kind of fun to look and see what the fastest wind was, when it really blows. So far, I haven't hooked this up to any APRS stuff.

Me, I prefer the wired versions of everythings, since I didn't want to spend the money, and jeez, I got a billion antenna wires and things coming out of my house anyway. Two more won't matter, I figure.

For mounting, I picked up a 10 foot Radio Shack mast, and stuck it on and old chimney mount that I had used for antennas awhile back.

Do the Alinco TNCs share the bug present in the Kenwood TNCs - which is
the failure to acknowledge frames unless the Poll bit is set?

The Kenwood TNCs seem to have no ack timer, and simply do not acknowledge
frames without the Poll bit set.  What usually happens, is the the 'other end'
times-out waiting and issues a RR with the Poll bit set, which elicits an
ack from the Kenwood.

This doesn't happen when using one Kenwood to connect to another, as it
*always* sets the Poll bit and always receives an ack immediately.
```

It really kills the effective throughput when connecting to most any
other station. Kenwood seems to have ignored my letter written in
May, complete with a packet trace of the problem.

I think Rob is right.  There are some very basic things that you are
trying to discuss that are in books on packet.  You also need to learn
a few things about radio in general - you don't seem to understand
receiver desense, intermod, or cross-band operation, just to name a few.

I'm building a PAD-207 TNC kit but having trouble getting it going does anyone know of a site that would have a BIN file of the EPROM software. The E-PROM is only marked TNC +. The source of the kit is unknown and i have had it for about 18 months now.

Thanks for you help.

Just passed my Extra examination, and I'm left with kind of a empty feeling. Even though I won't be using CW any time soon, I think it would have been better if I HAD had to pass a 10, 13, or even 15wpm test in addition to the written exam(forget 20wpm!).

If there hadn't have been such ruthless opposition to the lowering of the requirements at some earlier date, to some reasonable numbers(say 5/10/15 N/G/E), I doubt if we would have seen this "rubber-band" effect of having 5wpm Extras.

Oh well, now I can devote more time to my applications, like the towers
I'm building, and the high-speed wireless Internet gateways I want to
set up. I even decided to finally join the ARRL. I'll probably even
buy a new ARRL handbook(my 1994 version is getting a bit old).

For me, restructuring has been a pretty good thing. It got me back
into the hobby(which I had distanced myself from back in 1995, when it
appeared to me to be firmly stuck in the past). However, I think it
just went a bit too far. The ARRL's recommendation of 13wpm(or was it
10 or 12?) for Extras was pretty much right on. It just came so late,
that they had lost all credibility by then. What a shame.

Congratulations. There is something to be said for passing the written exam! And yes I agree about the code, but if you are not going to use it, then what the heck. I personally love cw and prefer it over voice, but whatever works to assure the health of the hobby.

Take it on as your challenge to become a technical expert in the advanced areas of radio, learn and share the knowledge -- that builds credibility!

Congrats on passing the exam and best wishes!!

There's plenty of certificates out there to replace the one from
the Federal Government.

When you learn CW at 35 WPM, or even the POW tap code
at 15 WPM, you will find a diploma with gold stars to be had.

Too complex, will take you years to design and work out the bugs.
It may even reduce the 56k effective rate by 25% with all the hops.
What if two hilltop nodes hear the same station?

Congrats to you and enjoy the new privleges!
I'm happy to see 'no-code' extras (aka extra-lites!). It will keep the
crowds out of the extra CW sub-bands here in the US! More room for us
'coded' extras to operate. I see ours as a dying breed, which will make
me a much need operator for contest and dxpeditions, hell we're already

in demand!
For those who say eventually there will be no code sub-bands... well
that's OK... by then I'll be a SK or perhaps have gone pure digital. I
do hope to live long enough to hear the digital mode ops laughing at
the obsolete SSB ops asking why they still use their mouths (HI).
Hey Stew, come on down to the lower 25 sometime... we'll be glad to
'talk' to you!

I was copying the mail on the way home about someone who got into PSK-31 and how well it worked.

With LW becoming more popular and with the expected LW US Amateur allocation somewhere in the FAR distance future. With narrow, slow and other limitations of LW, would this be a good mode to try out on the 1750 no license band?

hello has all,

I am testing the operation of the tnc3 and I have really evil has to have the clear idees. With the diskette of origin and after having to erase the memory flashes I included/understood well how to use the file apl and scr by copying them in RAM, but I do not have reussi has

to make them function in flash. I seized badly has what serves the
abs file.... Is it as I think it the bios? And why I find ap files
and apl in RAM after the operation of flash, since I am sense to have
libere this site
Well on does that become complicated when I think has to install
Xnet, how to take to me there?

I think of copying the apl, net (to publish for my needs), xts in
RAM,I believe that it is all and then I put them in memory flash
(flash -ae * apl... etc) but after must I modify the abs origin,
in my two tnc3 there are flashes 29c5001 the operation of the switch
is made how owing to the fact that there are not a scr or dipX.apl
I will need to connect my two tnc with a cord null modem.

thank you for your comments 73' Tony

Stuart, I took the Extra exam in 1954. Had to copy 20 wpm for at least a minute solid copy and send enough to convince the FCC Examiner that I knew the code. Took the written, which at that time was composed of 50 of the most often missed questions on the commercial license exam elements. I passed all that and got one of the first 10 Extras issued in the Dallas district.

So, I go into the FCC data base as "AE"

Now, you took your code and written tests and passed them.

You go into the FCC data base as "AE"

What's the difference and who cares!

Operate and have fun and use that extra theory study to learn even more for the enhanced enjoyment of the hobby. Nothing says that you cannot continue to practice and operate and build up your code speed.

I started as a ham at age 16 on 20 meter CW back when newcomers were not cut very much slack. But, I got on there with all the big boys and their Vibroplexes with my little straight key and had a ball. In three months I was running 35 wpm with *my* bug!

Welcome!

Stewart,
And having to pass a high-speed code test for your Extra would have made you a more technical, competent, more capable ham by ....??? Don't have a guilt complex. You passed the test and earned your Extra, just as I and others did in the past when the written requirements were very different. (100 questions, draw schematics, etc....) It's a different era, and the test process is appropriate to this era. As you mention, this change got you back into ham radio. That can only be a positive. So, continue your learning now that you have an Extra....get involved with digital modulation modes, satellites..etc. But don't let the "code forever" OF's here on this NG make you feel like less of an Extra. Besides, those old curmudgeons won't be around forever. :)

Digital radio certainly DOES include voice modes, Dennis. I expect that most hams will continue to choose voice modes as their primary ham communication.

> Hey Stew, come on down to the lower 25 sometime... we'll be glad to 'talk' to you!

Careful, Dennis; it is perfectly legal, albeit not considered gentlemanly, to transmit digital signals on the lower 25 as long as they are data and not voice. Stew might give you exactly what you asked for.

Hey, I'm a code-forever OF, but I believe in code forever for Ed Hare; what others do within Amateur Radio, as long as it it within the constraints of Part 97, is fine by me. After all, if EVERYBODY showed up on 20 CW at the same time, my little QRP rig would be lost in the din. I, for one, appreciate the diversity within our ranks.

Stewart, I'm going to take you at your word that you truly feel this way. In my opinion, you're putting way too much emphasis on the test. Its just an entrance test, not a measure of your skill or knowledge. Its what you do after you pass the test, and get the license, that really matters. Think about all the new possibilities, and privileges, now available to you. Do something with those new privileges, and I'm sure you'll feel a lot better.

That's true. All testing is "dumbing down" as it is called. In schools and in professional exams, so I suppose there is no reason amateur radio should be exempt from the social change.

>As you mention,
>this change got you back into ham radio. That can only be a positive.
>So, continue your learning now that you have an Extra....get involved
>with digital modulation modes, satellites..etc. But don't let the "code
>forever" OF's here on this NG make you feel like less of an Extra.
>Besides, those old curmudgeons won't be around forever. :)

Actually the thing most people seem to dislike is the fact the technical tests are getting easier along with the code. If the people who had the FCC's ear were really interested in amateur radio, they would have made an entry level license available for digital modes or general voice and restricted CW on HF, like a low-code tech exam with expanded privleges and a bit less theory.

Instead, the motive was to sell radios and other goods. That meant an automatic upgrade was the best means to the end goal.

What I dislike about the restructing is they actually made getting into the hobby no better....they actually made it worse. The main function seems to be lowering the bar for all classes of license, and lowering it the most for the highest classes.

I understand that from Kenwood's view. They are teetering on the edge, and wanted to sell radios to stay in business. They tried to sell radios at truckstops, but the hams stopped that so they needed another way to spur sales.

It makes sense for W5YI, because he has long been for a communicator-type of license. He also makes his money when people test and study.

The problem is it doesn't make sense for our hobby, because we made getting in no better...or actually worse. In the United States, the number one priority is making all people equal...regardless or effort or ability.

35wpm?! My god! I'll be lucky to ever get to 15wpm on Morse - let alone the POW tap code.

Probably not. PSK31 is not great with static crashes etc. You may want to try one of the newer modes like SLOWFELD, THROB or MFSK16 (if they are allowed on 1750).

And if we take him at his word that he really does wish that he had passed a 10, 13 or 15 wpm test, he is certainly free to increase his code speed to 15 wpm, or beyond, if he likes. I am sure we can look back later and see if he really meant what he said by seeing if he increases his code speed to 10, 13 or 15 wpm.

The bottom line is that most of us are not bound by the limitations that existed in the tests we took to enter ham radio. The old timers, some of whom took a test that I would judge to be harder than the ones I took, are free to learn modern radio technology that was not found on the exams of 1932. The hams of my era are free to learn more than was on the 16-page study guide we studied to get all amateur priveleges in 1963. Newer hams are free to learn more than is found in the 1000-odd questions in the pools and are free to learn anything that they feel should be on the tests.

I wish Stew well in what he chooses to do within amateur radio. He has clearly indicated an interest in digital communicaitons, a real "development opportunity" for ham radio. If, as he just stated, is also interested in CW communications, I am sure he will succeed at that, too, and will find many a willing Elmer to help bring him along.

73,
Ed Hare, W1RFI

There is another ham who is interested in passing the 5wpm test, and it dawned on me that it would be more interesting to make actual contacts via Morse Code over the Internet, than only following a practice course.

Due to the herky-jerky nature of TCP/IP, each sender's transmission would have to be buffered, but it should work pretty good. I would assume there would just be some small delay in the handshake(a few seconds at most - kind of what you get when you play a video over the Internet).

I did a quick perusal of the available Morse Code programs out there, and couldn't come across anything that did this. Anyone out there know of anything like this?

I suppose one who to accomplish this would be to use an on-line voice chat group, and just feed thru the audio tones. I haven't used these on-line voice chat groups - so I don't know how feasible this would be.

Part 15 network cards can be had for as little as $120(maybe less).
Getting hooked up to DSL/cable modem is going to cost you that or more
just to start - and then $39.95/mo thereafter.

This one is ideal for those who want to use low level constant outputs
from the Icom accessory connector. It has an op-amp in the receive
line to provide some gain. I use a very similar circuit between my
IC761 and PTC-II.

Yes, RIGBLASTER uses one opto-isolator on the RS232 line to key the rig's PTT line. Not a big deal at all.

Instead of using a transistor, you use a opto-isolator to key the PTT line. The circuit is simply a 4N33 opto-isolator, one or two diodes, and one resistor. It provides better isolation and costs only a dollar or so more than the transistor keying circuit. See www.qsl.net/wm2u for a simple circuit.

BUT RigblASTER does NOT use any opto-isolators on the audio lines between the sound card and rig. I think you will find that RigBlaster simply uses audio isolation transformers. Audio isolation transformers will work fine but do not provide the same level of isolation and protection as opto-isolators. For the price of a RigBlaster, you would have thought that opto-isolators would have been used throughout. It would not have cost much more.

Dick,

I think you will find that RigBlaster does NOT use a power transformer to power the 4N33 opto-isolator. The transformers in RigBlaster are more likely audio isolation transformers used to break up any ground loops on the audio lines to and from the sound card.

It is my understanding that RIGBLASTER only uses one opto-isolator for the PTT keying circuit. Instead of a transistor, an opto-isolator is used. Most opto-isolator PTT keying circuits consist of one opto-isolator, one or two diodes and one resistor. Not very complicated at all. For an example of such a circuit, see www.qsl.net/wm2u

Personally, I would have liked to have seen opto-isolators used NOT ONLY on the PTT keying line BUT ALSO on BOTH of the audio lines to and from the sound card. It would have not cost much more.

Hi Jim,

Yes, RITTY may work just fine under Windows 95. But Windows 98 is a different story for many Hams.

Many DOS programs appear to run much better under Windows 95 or DOS than Windows 98. (e.g. CT runs much better if run from DOS not in a Windows 98 DOS box). In fact, some OEM versions of Windows 98 will not let a DOS program launched from windows to even access the serial COM ports. This can be a BIG problem for DOS terminal or communications programs or DOS programs that use the serial COM port to key the PTT line of the rig. I do not think that the OEM versions of Windows 95 ever had this problem.

(Windows 98 that came with my Toshiba has this problem. According to Toshiba, if you boot directly into DOS at startup, the DOS program can access the serial COM ports. They are right!)

By all means try running each DOS program from windows but if it doesn't work then try booting to DOS directly at startup and running the program. For many Hams that solves the problem.

Why wouldn't you use a system based on part 15 devices, for crying out
loud? It is faster, cheaper, and proven. You are going to have enough
trouble getting your sites set up properly, without having to worry
about cobbling together a bunch of expensive and lower-performing
equipment.

> I think you will find that RigBlaster does NOT use a power
> transformer to power the 4N33 opto-isolator.

It does require an external 12 VDC power source to operate the opto-isolator and the relays though. They provide a wall wart.

> The transformers in RigBlaster are more likely audio isolation
> transformers used to break up any ground loops on the
> audio lines to and from the sound card.

RigBlaster handles ONLY the PTT and Tx audio lines. Receive audio does not pass thru the RigBlaster. Transmit audio does pass through an isolation transformer.

> Personally, I would have liked to have seen opto-isolators used

> NOT ONLY on the PTT keying line BUT ALSO on BOTH of
> the audio lines to and from the sound card. It would have not
> cost much more.

I think it would have cost considerably more. You can't simply pass audio through and opto-isolator. It would require proper biasing and audio amps. Just another place to create distortion and ruin the IMD on the receive and transmit signals. Isolation transformers are a much more reasonable approach.

By the way, a transformer can break up a ground loop even if there are other ground connections between the computer and the rig. If properly connected, the transformer will prevent the ground currents from flowing through the shield of the audio line where it causes the most problem. Actually, even if you isolate the receive line, the transmit line and the PTT circuit you will (I hope) still have a common ground via the power line safety ground. The rig and the computer are never totally isolated - if they are they you could have a shock hazard.

Yes, if you use opto-isolators on the audio lines to and from the sound card you will need to also use op amps and the proper biasing circuitry. Such a circuit is very easy to build and design. G3VFP Has recently designed and built such a circuit. But I don't think that such a circuit would considerably add to the cost of a RigBlaster. (I am not talking about selling price but cost). The cost of the circuit board would be about the same and the extra cost for the additional parts would not be very much. If there was any significant additional cost, it would likely lie in the extra cost in building such a unit. Yes, the circuit must be designed properly but that is part of what you are paying for when you buy a commercial product.

The REAL advantage of using opto isolators is to better protect your computer's sound card from any dangerous voltages coming from the rig or vice versa due to malfunctions or improper installation.

Yes, I agree that there is always a ground connection between the computer and rig via the AC ground line. Complete isolation is not possible nor desirable. But the real goal of any sound card interface is to break up the ground loops on BOTH of the AUDIO LINES to and from the sound card and on the PTT line. Audio isolation transformers do a good job at breaking up the ground loops on the audio lines.

But some HAM's defeat the purpose of using audio isolation transformers in the first place by using a simple one transistor, one diode and one resistor circuit to key the PTT line of the rig. Such a simple one transistor etc PTT keying circuit provides a direct ground connection between the rig and computer which can cause havoc when transmitting. It is best that any ground loop on the PTT keying circuit be broken up by using a relay or opto isolator. I think RigBlaster uses an opto isolator on the PTT keying circuit.

You mention that RigBlaster does NOT offer ANY isolation on the receive audio line. That is too bad. If the Receive line is connected directly between the rig and computer, RigBlaster may not solve the problem created by ground loops. In some cases, ground loops on BOTH the Receive and Transmit audio lines NEED to be broken up using audio isolation transformers (or opto-isolators). It sounds like RigBlaster only does half the job on the audio lines.

In my view, the ideal interface would consist on two audio isolation transformers and variable POT's on the audio lines to and from the computer and a simple opto isolator PTT keying circuit consisting of one opto-isolator, two diodes and one resistor. If you don't have a packet or accessory jack on your rig and must use your rig's mic jack, then you may want to throw in a switch. For circuit diagrams see http://www.qsl.net/wm2u/interface.html and http://www.w5bbr.com/soundbd.html. LESS THAN TEN PARTS ARE TYPICALLY NEEDED.

In my view, such a circuit is NO more complicated than a HAMCOMM interface and should have a similar selling price. (e.g the selling price for a BayPac Hamcomm style interface is $49.95. I don't think it will be long before someone starts selling a sound card interface for somewhere between $40 and $50 US that break up the ground loops ON BOTH of the audio lines to and from the sound card AND on the PTT line).

This is a very risky thing to do. If something shorts in the power supply on the computer you may have 120 volt difference between the rig chassis and the computer chassis. I'd sure look for a safer solution to a ground loop problem.

I'm not sure where all this ground loop problem comes from anyway. Perhaps some of what is thought to be a ground loop is actually RFI caused by having RF on the radio chassis. I've interfaced a lot of stuff (sound cards, packet boards, TNCs, etc) to various rigs over the years without any ground isolation and never had a ground loop problem.

I think you are confusing isolation with protection.

Yes, even with optocouplers (or optoisolators) the chassis of the computer and rig are tied together via the green wire or ground in the AC wires.

But even with this common ground connection via the AC lines, audio isolation transformers and optocouplers break up the ground loops on the audio lines and PTT lie and REALLY help prevent hum etc. They do work! A lot of telephone modem manufacturers use audio isolation transformers to break up ground loops. Old telephone modems are a great source for audio isolation transformers if you can't buy new ones locally.

But optocouplers do MORE than just break up ground loops. Optocouplers also help isolate and PROTECT your computer from any dangerous voltages from the rig and vice versa due to any malfunctions, short circuits and improper installation. Audio isolation transformers don't do that. If you really want to protect your rig and computer, I contend that you should use optocouplers throughout NOT JUST on the PTT line.

Audio isolation transformers just break up ground loops. Optocouplers break up ground loops and also help isolate and PROTECT your rig and computer from dangerous voltages.

By the way you can buy or build a device using optocoupler technology to completely isolate the RS-232 connection between your computer and your KACHINA rig.

I have seen posts where HAM's contend that you canot break up ground loops on the RS-232 line. This is not true. They can be broken up using a series of optocouplers and op amps. To isolate all the 25 pins in a RS-232 25 pin connector, the device will use quite a lot of optoisolators. But since most HAM applications only use 5 or so pins or lines, a simpler device can be used.

Well, I do not think that most transmit problems are caused by RFI. Just listen on the ham bands. Hum due to ground loop problems is very common on the ham bands. But you typically cannot hear the hum unless the signal is very strong.

I once had a ground loop problem with a MIC. I only found out about it when a local station noticed the problem. When I switched the mic, the hum was gone. When I listened VERY carefully to the transmit audio monitor, I could hear a VERY LOW hum when using this problem mic. You must listen carefully. I found a problem with the mic wiring. I fixed the wiring and the hum disappeared.

Some Hams do not even realise that they have a ground loop problem. They never even listen to the transmit audio (or even the receive audio) when using the digital modes. If they never listen CAREFULLY, they will never know unless someone tells them -- typically another local station.

For many digital modes, you can still be copied (but usually not as well) by another station if you have a ground loop problem. The DSP based filters used by most sound card programs typically filter out the hum.

The same thing typically happens when you use a mic with ground loop problems. Most Hams can still copy your audio but not as well. Sometimes only local stations can hear the hum in your mic's audio. e.g. I operated most of a contest with this problem mic and made lots of contacts. No one ever complained about the hum until a LOCAL station heard my signal. DX stations could not hear the hum even when I asked for a audio quality report!

I have not heard many stations complain about RFI problems when using a computer's sound card as the modem. This can be partly explained by the presence of RFI bypass capacitors INSIDE the VAST majority of rigs. In most cases, you really do not need RFI bypass capacitors and other RFI prevention measures inside a sound card interface device UNLESS you are using one of the FEW rigs that do not have RFI bypass capacitors inside.

I have a group of people interested in getting a network going for the sole purpose of sharing weather data live, and mobile. We also have potential funding, if we can show that it works. So because this network is being designed by a group of people who all want the same thing out of it, we may have a chance of succeeding.

I was only responding to your argument that the MFJ switch box and the RigBlaster are very similar in complexity and therefore should cost roughly the same. I contend that the RigBlaster is several times more complex than the MFJ, and that if the MFJ is "worth" $40, then the RigBlaster is easily "worth" $80 or more. I speak from 30 years of experience in aerospace and commercial electronic manufacturing, including cost estimating.

It's unlikely that a 486 will do the job. You need brute CPU
power, which means a 486DX/66, minimum. At that, it will
be breathing pretty hard. Anything slower will not be viable.
Don't even think about a 486SX.

The software you seek may never have been written for Windows
3.1. If there's anything around, it will be in the usual
repositories, like simtel and cica.

Sorry.

An interesting thought is that despite the optocoupler for the PTT line and the isolation transformer in the transmit audio line to the radio mic input, the computer chassis is tied directly to a-c protective ground through the "green" wire in its power cable, as is the radio. Thus, the two chasses are connected despite the presence of the optocoupler and the transformer. Some folks have had to resort to two-prong a-c adapters to break up this common connection when operating PSK31 and other digital modes involving the computer.

The situation is even more interesting when you consider a computer-controlled radio like my Kachina. There the RS232 cable to the radio runs a wire from computer chassis ground to radio chassis ground as the common for computer/radio communications. Thus, there is yet another conductor circumventing the optocoupler and transformer "isolation."

I don't know about you folks, but my interface consists of two shielded audio cables from Radio Shack. No ground loops, no feedback, no hum. Lab tests on the Kachina in PSK31 mode, with a separate station in the shack, shows that the third-order IMD component is 35 to 38 db down. That is on the air, not into a dummy.

Ha ha ha! Har! Giggle.

So far reported into this newsgroup is exactly ONE link using
Part 15 devices. It spans a whole 5 miles. If anyone has had
better luck than that, they have not reported it.

You doing better? Tell us about it.

If you cannot recall what we are doing here in this part of the USA,
a perusal of past posts to this newsgroup will enlighten you.
With that dedicated group with common interest, one can indeed
build a working network spanning hundreds of miles. No, it is
not cheap ... but it can be done, and it HAS been done. Part 15
devices are totally useless for this kind of network.

"Part 15 devices: Very limited short range plug and pray."

X-Admin: news@aol.com

I have a Yaesu FT-840 that I am trying to use the Rigblaster with. Using Digipan, I have not been able to get the automatic keying to work. When I plug in both the serial cable and audio in from the computer to the Rigblaster, the automatic keying does not work. With the audio in disconnected, the automatic keying works fine, but of course, there is no transmit audio.

The jumpers are set as per the manual for Yaesu rigs and all michrophone functions work correctly. I can send PSK31 if I key the rig manually.

Any help would be appreciated.

I'm not familiar with part 15 devices what are they? Also would they allow a storm chaser to pull over 20km out of town, pull out their laptop and login?

WinWarbler allows you to conduct QSOs using the PSK31 mode developed by Peter Martinez, G3PLX. To aid PSK31 DXers, WinWarbler can simultaneously decode and display PSK transmissions on three separate frequencies. A PC running Windows 95, 98, 2000, or NT is required. WinWarbler is free, and contains no advertising. Commercial use is expressly forbidden.

WinWarbler utilizes the PSK engine developed by Moe Wheatley, AE4JY; by encapsulating his expertise in a reusable component, Moe has reduced the time required to develop a PSK31 application to a few days (including a couple of transatlantic flights). The WinWarbler installation package includes version 1.05 of Moe's PSKCore.DLL.

You can download WinWarbler 1.0 from http://www.qsl.net/winwarbler/ - consider this a beta release, as testing to date has been limited to a dozen QSOs; defect reports, comments, and suggestions will be gratefully accepted. WinWarbler's online help is provided in HTML, which you can evaluate at http://www.qsl.net/winwarbler/Help/ before downloading the entire package.

WinWarbler is written in Visual Basic; source code will be made available for non-commercial use at the completion of the beta period.

73,

Dave, AA6YQ

The WWW is a joke on society, it will never last.
The VT-100 interface is right up there next to God!

> ISDN speed of 64 Kbit can carry the trafic of one user
> provided he isn't running any considerable server stuff.

Hogwash. I had 5 users running 33k 24hr/7day links on a
64k link. It's what you do that counts. If you want to steal
music or files on Napster, etc, then yes, stealing takes a lot
of bandwidth. Rather than pay big bandwidth bucks to
steal, you could go with a 9600 baud modem, and go buy
the fricking CD.

Nope. Neither will 56k. You're talking very wide channels with no FEC.
Range without beams is very short. Use a TV station as an example.
Very high power, 6 MHz bandwidth. How far can you see the megawatt
station reliably? Not far enough...

5 miles is emergency communications around here. Makes a
great repeater link (data, video, and voice).

> No, it is not cheap ... but it can be done, and it HAS been done.
> Part 15 devices are totally useless for this kind of network.

I agree. BBS is a low baud affair. Higher speed is unjustified.

> "Part 15 devices: Very limited short range plug and pray."

Not very original, and not very true. Long range at high bit rates
is different than long range at low bit rates.

Either mode is purely pluggable, neither requires religious
devotion.

This is not a problem, this is "Innovation". You know, the thing that Bill Gates thinks you will be deprived of when the government gets its way.

Those programs will probably run just fine in DOSEMU under Linux. Because that is more like a real DOS box.
VMWARE running DOS under Linux or Windows NT will be even better. That provides a virtual PC running DOS. You can run Windows 98 in another virtual PC if you like.

When you want to run legacy DOS applications, you should not upgrade your OS too often.   Especially not when the supplier of the OS wants to bash DOS out of this world.

The fact that you apparently are lucky and don't see the problem in your
own shack does not mean the problem does not exist!

It depends on details that are difficult to predict and prevent.  You may
have big problems when you install a different antenna or upgrade your
computer.

I agree with that.  Transformers somehow seem to have a bad name, but
a transformer that handles 5 kV between primary and secundary and has
very good audio characteristics can be found in any telephone modem.

These are mass-produced items costing very little.

Optocouplers are tricky devices that are not easy to use in demanding
applications (linearity, fast switching).  Avoid them when you can use
other methods.

It looks like you do not understand what a ground loop is...

A ground loop is a circular connection of ground between two or more points. In this situation: both transceiver and computer have their ground connected to the safety ground of the mains, and their grounds are also connected together via a signal cable.
Now you have a loop connecting three points. Any magnetic field spanned by this loop will induce current in it, and this current my get converted into voltage when there are some non-ideal connections involved.
This voltage is then added to the modulation signal (in this case).

Putting isolation transformers somewhere in this loop (can be in the signal path, can be in the mains connection) you break the loop.
OF COURSE the two boxes are still connected (unless you have at least two points of insulation), but the point is that no CURRENT can flow through the loop anymore, and thus no voltage is introduced anymore.

>Some folks have had to resort to two-prong a-c adapters to

Those guys did not solve it in a safe and sound way.

That is why controlling a radio using RS232 is not a very clever thing to do. They should have at least isolated the RS232 interface from the
